

SERVICE MANUAL

SPLIT TYPE AIR TO AIR HEAT PUMP

MODEL **12LR-N**
09LR-N

In the interests of user-safety (Required by safety regulations in some countries) the set should be restored to its original condition and only parts identical to those specified should be used.

Parts Guide

Parts marked with "⚠" are important for maintaining the safety of the set. Be sure to replace these parts with specified ones for maintaining the safety and performance of the set.

CHAPTER 1. SPECIFICATION

[1] SPECIFICATION

1. 12LR-N

ITEMS		MODEL	INDOOR UNIT	OUTDOOR UNIT
			12LR-N	
Rated cooling capacity (Min– Max.)		kW	3.50 (1.40 - 4.00)	
Rated heating capacity (Min–Max.)		kW	4.20 (1.40 - 6.00)	
Moisture removal (at cooling)		Liters/h	1.2	
Electrical data				
Phase			1	
Rated frequency		Hz	50	
Rated voltage		V	220-240	
Rated current ☆ (Min - Max.)	Cool	A	4.7 (2.0 - 6.3)	
	Heat	A	4.6(1.7 - 8.2)	
Rated input ☆ (Min - Max.)	Cool	W	980 (350- 1300)	
	Heat	W	970 (290 - 1700)	
Power factor ☆	Cool	%	91	
	Heat	%	92	
Maximum operating current		A	9.1	
Compressor	Type	Hermetically sealed rotary type		
	Model	5RS102XBE01		
	Oil charge	RB68A 320cc		
Refrigerant system	Evaporator	Louver Fin and Grooved tube type		
	Condenser	Corrugate Fin and Grooved tube type		
	Control	Expansion valve		
	Refrigerant (R410A)	1140g		
	De-ice system	Micro computer controled reversed systems		
Noise level (at cooling)	High	dB(A)	43	48
	Low	dB(A)	–	–
	Soft	dB(A)	27	–
Fan system				
Drive		Direct drive		
Air flow quantity (at cooling)	High	m3/min.	9.8	32.5
	Low	m3/min.	7.5	–
	Soft	m3/min.	5.2	–
Fan		Cross flow fan	Propeller fan	
Connections				
Refrigerant coupling		Flare type		
Refrigerant tube size Gas, Liquid		3/8", 1/4"		
Drain piping mm		O.D φ16		
Others				
Safety device		Compressor: Thermistor		
		Fan motors: Inherent thermistor		
		Fuse, Micro computer control		
Air filters		Polypropylene net (Washable)		
Net dimensions	Width	mm	770	780
	Height	mm	260	540
	Depth	mm	248	265
Net weight		kg	9	34

NOTE: The conditions of star"☆" marked item are based on 'EN14511'.

2. 09LR-N

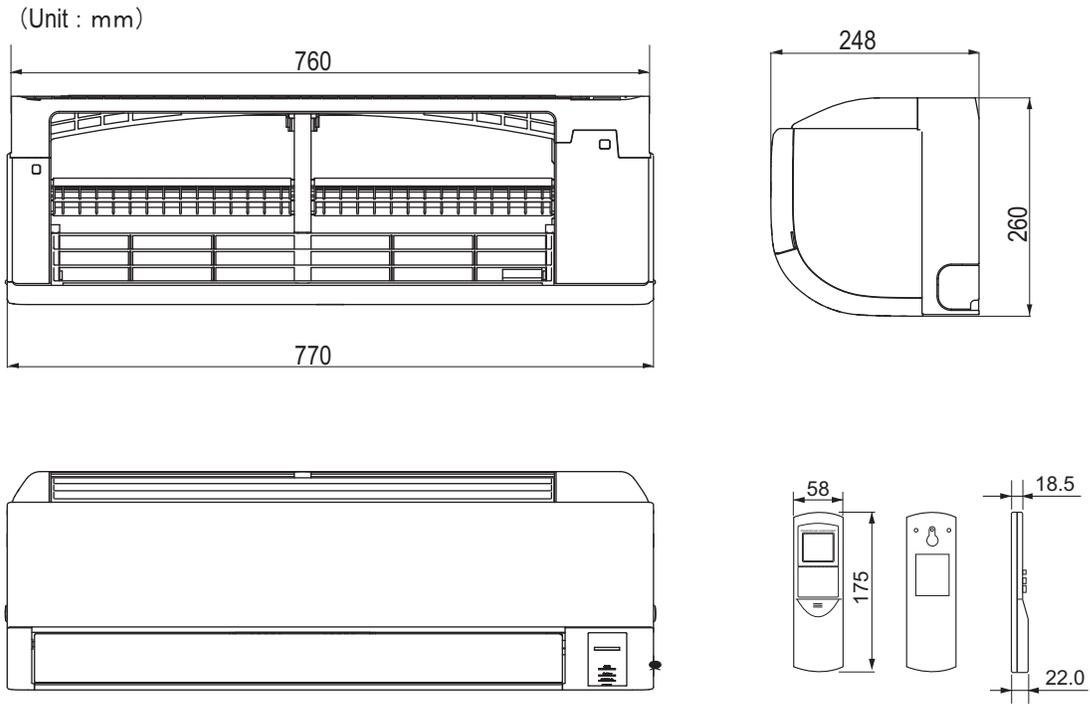

ITEMS		MODEL	INDOOR UNIT	OUTDOOR UNIT

1.2. Printed wiring board

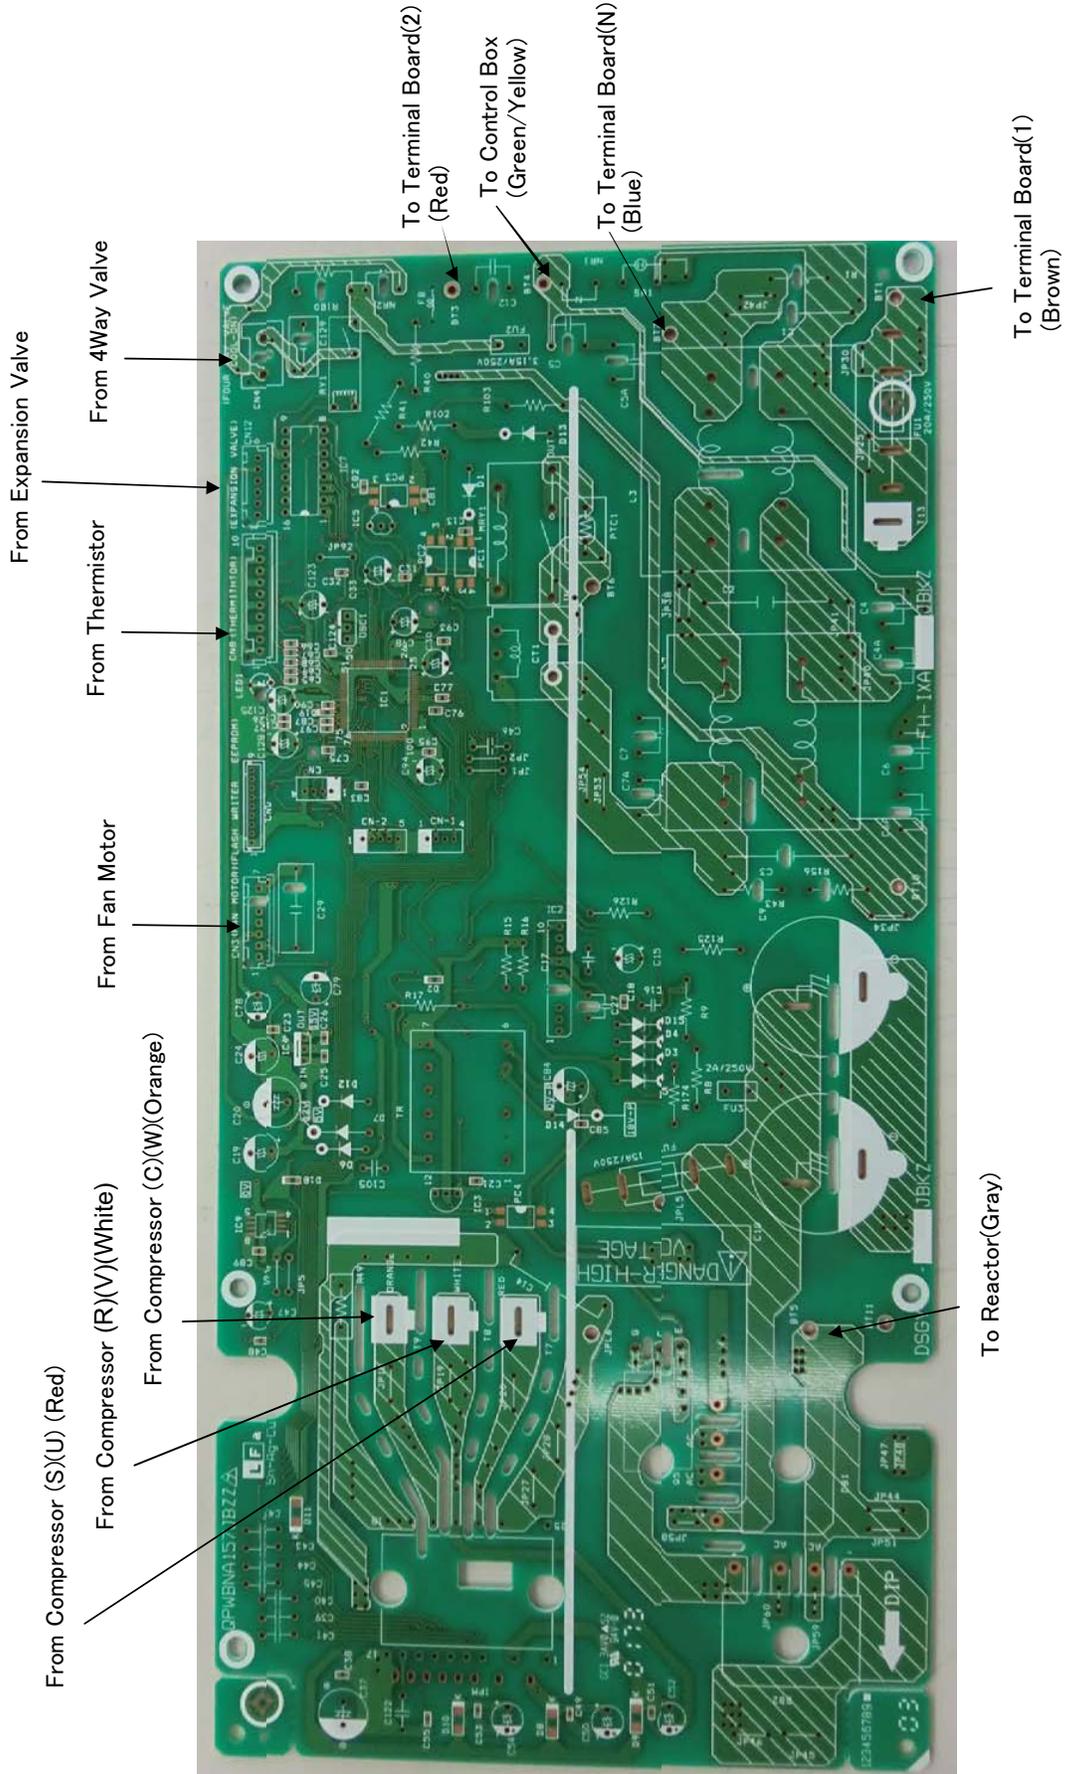

2. Outdoor unit

2.1. Electronic control circuit diagram

2.2. Printed wiring board

[3] FUNCTION

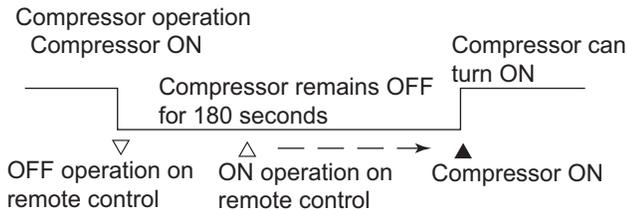

1. Function

1.1. Restart control

Once the compressor stops operating, it will not restart for 180 seconds to protect the compressor.

Therefore, if the operating compressor is shut down from the remote control and then turned back on immediately after, the compressor will restart after a preset delay time.

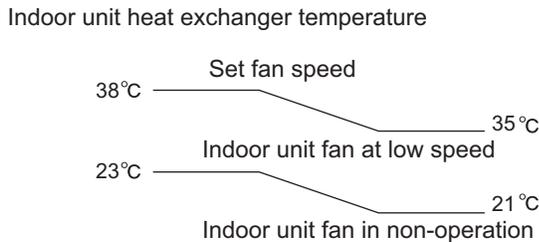

(The indoor unit will restart operation immediately after the ON switch is operated on the remote control.)

1.2. Cold air prevention control

When the air to air heat pump starts up in heating mode, the indoor unit fan will not operate until the temperature of the indoor unit heat exchanger reaches about 23°C in order to prevent cold air from blowing into the room.

Also, the indoor unit fan operates at low speed until the temperature of the indoor unit heat exchanger reaches about 38°C so that people in the room will not feel chilly air flow.

1.3. Indoor unit heat exchanger freeze prevention control

If the temperature of the indoor unit heat exchanger remains below 0°C for 4 consecutive minutes during cooling or dehumidifying operation, the compressor operation stops temporarily in order to prevent freezing.

When the temperature of the indoor unit heat exchanger rises to 2°C or higher after about 180 seconds, the compressor restarts and resumes normal operation.

1.4. Outdoor unit 2-way valve freeze prevention control

If the temperature of the outdoor unit 2-way valve remains below 0°C for 10 consecutive minutes during cooling or dehumidifying operation, the compressor operation stops temporarily in order to prevent freezing.

When the temperature of the 2-way valve rises to 10°C or higher after about 180 seconds, the compressor restarts and resumes normal operation.

1.5. Indoor unit overheat prevention control

During heating operation, if the temperature of the indoor unit heat exchanger exceeds the indoor unit heat exchanger overheat prevention temperature (about 45 to 54°C) which is determined by the operating frequency and operating status, the operating frequency is decreased by about 4 to 15 Hz. Then, this operation is repeated every 60 seconds until the temperature of the indoor unit heat exchanger drops below the overheat protection temperature.

Once the temperature of the indoor unit heat exchanger drops below the overheat protection temperature, the operating frequency is increased by about 4 to 10 Hz every 60 seconds until the normal operation condition resumes.

If the temperature of the indoor unit heat exchanger exceeds the overheat protection temperature for 60 seconds at minimum operating frequency, the compressor stops operating and then restarts after about 180 seconds, and the abovementioned control is repeated.

1.6. Outdoor unit overheat prevention control

During cooling operation, if the temperature of the outdoor unit heat exchanger exceeds the outdoor unit heat exchanger overheat prevention temperature (about 55°C), the operating frequency is decreased by about 4 to 15 Hz. Then, this operation is repeated every 60 seconds until the temperature of the outdoor unit heat exchanger drops to about 54°C or lower.

Once the temperature of the outdoor unit heat exchanger drops to about 54°C or lower, the operating frequency is increased by about 4 to 10 Hz every 60 seconds until the normal operation condition resumes.

If the temperature of the outdoor unit heat exchanger exceeds the outdoor unit heat exchanger overheat protection temperature for (120 sec : outdoor temperature ≥ 40°C • 60 sec : outdoor temperature < 40°C) at minimum operating frequency, the compressor stops operating and then restarts after about 180 seconds, and the abovementioned control is repeated.

1.7. Compressor overheat prevention control

If the temperature of the compressor exceeds the compressor overheat prevention temperature (110°C), the operation frequency is decreased by about 4 to 10 Hz. Then, this operation is repeated every 60 seconds until the temperature of the compressor drops below the overheat protection temperature (100°C).

Once the temperature of the compressor drops below the overheat protection temperature, the operating frequency is increased by about 4 to 10 Hz every 60 seconds until the normal operation condition resumes.

If the temperature of the compressor exceeds the overheat protection temperature (for 120 seconds in cooling operation or 60 seconds in heating operation) at minimum operating frequency, the compressor stops operating and then restarts after about 180 seconds, and the abovementioned control is repeated.

1.8. Startup control

When the air to air heat pump starts in the cooling or heating mode, if the room temperature is 2°C higher than the set temperature (in cooling operation) or 3.5°C lower (in heating operation), the air to air heat pump operates with the operating frequency at maximum. Then, when the set temperature is reached, the air to air heat pump operates at the operating frequency determined by fuzzy logic calculation, then enters the normal control mode after a while.

1.9. Peak control

If the current flowing in the air to air heat pump exceeds the peak control current the operation frequency is decreased until the current value drops below the peak control current regardless of the frequency control demand issued from the indoor unit based on the room temperature.

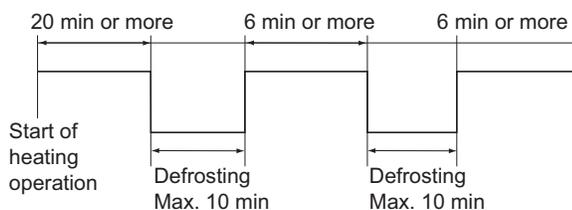

1.10. Outdoor unit fan delay control

The compressor stops immediately after cooling, dehumidifying or heating operation is shut down, but the outdoor unit fan continues operation for 50 seconds before it stops.

1.11. Defrosting

1.11.1 Reverse defrosting

The defrost operation starts when the compressor operating time exceeds 20 minutes during heating operation, as shown below, and the outside air temperature and the outdoor unit heat exchanger temperature meet certain conditions. When the defrost operation starts, the indoor unit fan stops. The defrost operation stops by the state of cycle temperature or the defrosting time exceeds 6 minutes.

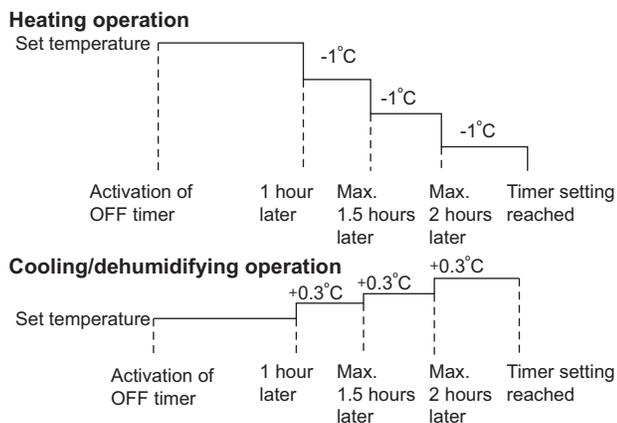

1.12. ON timer

The ON timer can be activated by pressing the ON timer button. When the ON timer is activated, the operation start time is adjusted based on fuzzy logic calculations 1 hour before the set time so that the room temperature reaches the set temperature at the set time.

1.13. OFF timer

The OFF timer can be activated by pressing the OFF timer button. When the OFF timer is set, the operation stops after the set time.

When this timer is set, the compressor operating frequency lowers for quieter operation, and the room temperature is gradually varied after one hour (reduced 1°C three times (max. 3°C) in heating, or increased 0.3°C three times (max. 1°C) in cooling or dehumidifying operation) so that the room temperature remains suitable for comfortable sleeping.

1.14. Power ON start

If a jumper cable is inserted in the location marked with HAJP on the indoor unit control printed circuit board (control PCB), connecting the power cord to an AC outlet starts the air to air heat pump in either cooling or heating mode, which is determined automatically by the room temperature sensor.

When a circuit breaker is used to control the ON/OFF operation, please insert a jumper as described above.

1.15. Self-diagnostic malfunction code display

1.15.1 Indoor unit

1) When a malfunction is confirmed, a flashing malfunction code number is displayed to indicate the type of malfunction.

When the air to air heat pump is in non-operating condition, holding down AUX button for more than 5 seconds activates the malfunction code display function.

The operation continues only in the case of a serial open-circuit, and the main relay turns off after 30 seconds if the open-circuit condition remains.

In the case of a serial short-circuit, the air to air heat pump continues operating without a malfunction code display.

The malfunction information is stored in memory, and can be recalled later and shown on display.

2) The self-diagnostic memory can be recalled and shown on the display by stopping the operation and holding down AUX button for more than 5 seconds.

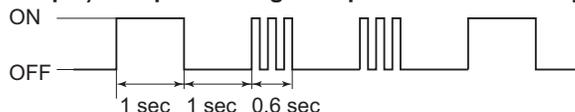

3) The content of self-diagnosis (malfunction mode) is indicated by a flashing number.

(For details, refer to the troubleshooting section.)

1.15.2 Outdoor unit

If a malfunction occurs, LED1 on the outdoor unit flashes in 0.2-second intervals as shown below.

(Example) Compressor high temperature abnormality

1.16. Information about auto mode

In the AUTO mode, the temperature setting and mode are automatically selected according to the room temperature and outdoor temperature when the unit is turned on.

Modes and Temperature Settings

		0	10	18	28	34	outdoor temp. (°C)
indoor temp. (°C)	26	Heat (24°C)	Heat (23°C)	Dry (Room Temp. -2°C)	Cool (24°C)	Cool (25°C)	Cool (26°C)
	21	Heat (22°C)					

the figures in () are temperature settings

During operation, if the outdoor temperature changes, the temperature settings will automatically slide as shown in the chart.

1.17. Difference of operation in Auto and Manual modes

In the Auto mode, the temperature setting is automatically determined based on the outside air temperature. In addition, the air to air heat pump operation differs from the operation in the Manual mode as explained below.

1.17.1 Difference relating to set temperature

	Auto mode			Manual mode		
	Cooling	Heating	Dehumidifying	Cooling	Heating	Dehumidifying
Temperature setting method	Automatic temperature setting based on outside air temperature. Can be changed within $\pm 2^{\circ}\text{C}$ using remote control.			Can be changed between 18 and 32°C using remote control.	Can be changed between 18 and 32°C using remote control.	Automatic setting. Can be changed within $\pm 2^{\circ}\text{C}$.

1.18. Dehumidifying operation control

If the room temperature is 26°C or higher when dehumidifying operation starts, the dehumidifying operation provides a low cooling effect in accordance with the room temperature setting automatically determined based on the outside air operation. (The setting value is the same as the set temperature for cooling operation in the auto mode.)

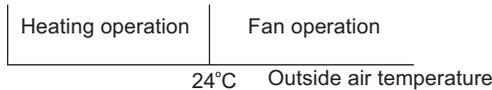

If the room temperature is lower than 26°C when dehumidifying operation starts, the dehumidifying operation minimizes the lowering of the room temperature.

1.19. Self Clean operation

Heating or Fan operation and Cluster operation are performed simultaneously.

The judgment of whether Heating or Fan operation is used is based on the outside air temperature at 3 minutes after the start of internal cleaning.

The operation stops after 40 minutes.

1.20. Plasmacluster Ion function

Plasmacluster Ion generator inside the air conditioner will release positive and negative plasmacluster ions into the room. Plasmacluster ions released into the air will reduce some airborne mold.

1.21. Hot keep

If the room temperature is in the Hot keep zone during heating, the compressor is turned off to prevent overheating.

ZONE	COM-PRESSOR	FAN	
		AUTO	Ultra soft (Lower than Fan speed "soft")
Hot keep (When room temperature reaches setting temperature)	OFF		
		SOFT LOW HIGH	Keep the setting

1.22. Winter cool

Cooling operation is available during the winter season by the built in winter cool function.

Lower limit of outdoor temperature range is -10°C DB.

When the outside air temperature is low, the outdoor unit fan operates at slower speed.

NOTE: Built-in protect device may work when outdoor temperature falls below 21°C DB., depending on conditions.

1.23. Auto restart

When power failure occurs, after power is recovered, the unit will automatically restart in the same setting which were active before the power failure.

1.23.1 Operating mode (Cool, Heat, Dry)

- Temperature adjustment (within 2°C range) automatic operation
- Temperature setting
- Fan setting
- Air flow direction
- Power ON/OFF
- Automatic operation mode setting
- Swing louvre
- Plasmacluster mode

1.23.2 Setting not memorized

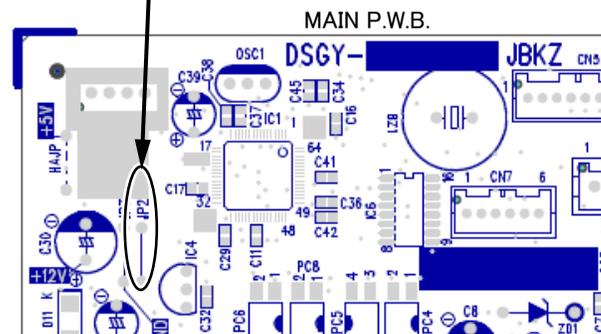

- Timer setting
- Full power setting
- Self clean setting

1.23.3 Disabling auto restart function

By removing (cutting) jumper 8 (JP8) on the printed circuit board (PCB), the auto restart function can be disabled.

1.24. Heat only mode.

When heat only mode, cut the JP2 jumper
 ■ cool/heat modeJP2 connected
 ■ heat only modeJP2 cut

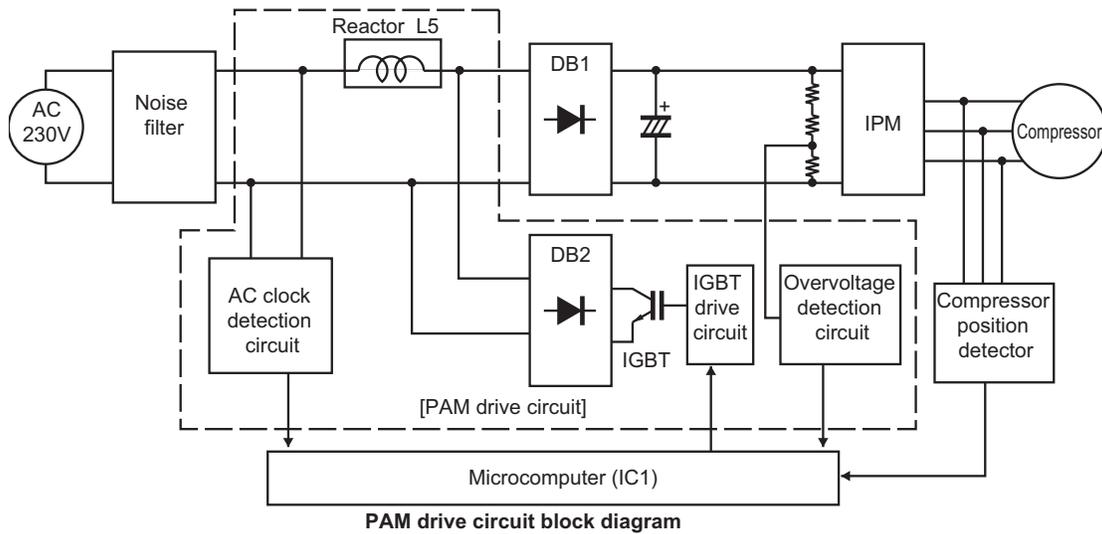

2. Outline of PAM circuit

2.1. PAM (Pulse Amplitude Modulation)

The PAM circuit varies the compressor drive voltage and controls the rotation speed of the compressor.

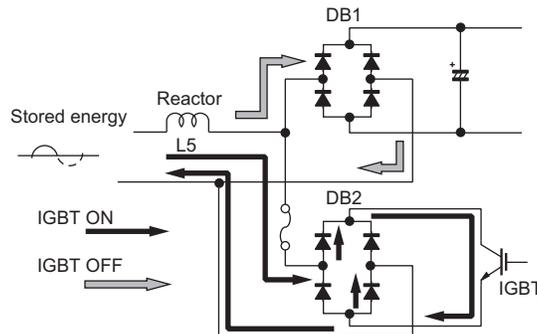

The IGBT shown in the block diagram charges the energy (electromotive force) generated by the reactor to the electrolytic capacitor for the inverter by turning ON and OFF.

When the IGBT is ON, an electric current flows to the IGBT via the reactor (L5) and diode bridge (DB2).

When the IGBT turns OFF, the energy stored while the IGBT was ON is charged to the capacitor via the diode bridge (DB1).

As such, by varying the ON/OFF duty of the IGBT, the output voltage is varied.

2.2. High power factor control circuit

This circuit brings the operating current waveform closer to the waveform of commercial power supply voltage to maintain a high power factor.

Because of the capacitor input, when the PAM circuit is OFF, the phase of the current waveform deviates from the voltage waveform as shown below.

To prevent this deviation, a current is supplied during the periods indicated by "O" in the diagram.

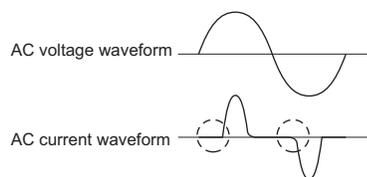

To determine the length of period to supply a current, the zero-cross timing of the AC input voltage is input to the microcomputer via the clock circuit.

The power source frequency is also determined at the same time.

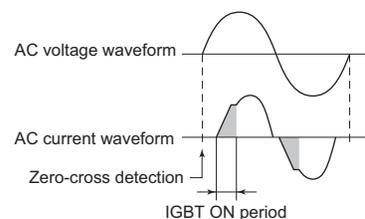

The IGBT turns ON after the time length determined by the zero-cross point to supply a current to the IGBT via the reactor.

This brings the current waveform closer to the voltage waveform in phase.

As described above, the ON/OFF operation of the IGBT controls the increase/decrease of the compressor power supply voltage (DC voltage) to improve the compressor efficiency and maintain a high power factor by keeping the current phase closer to that of the supply voltage.

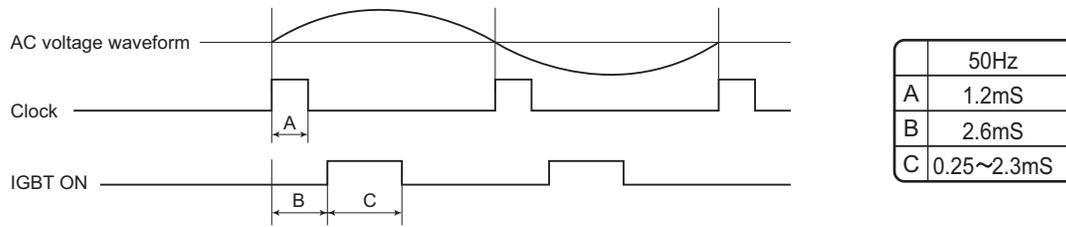

AC voltage and current waveforms when PAM is OFF

AC voltage and current waveform when PAM is ON

2.2.1 Detailed explanation of PAM drive circuit sequence

2.2.2 AC clock (zero-cross) judgment

- The clock circuit determines the time from one rising point of the clock waveform to the next rising point. The detected clock waveform is used to judge the power source frequency (50 Hz).
- The zero-cross of the AC voltage is judged as the rising of the clock waveform, as shown in the diagram above.

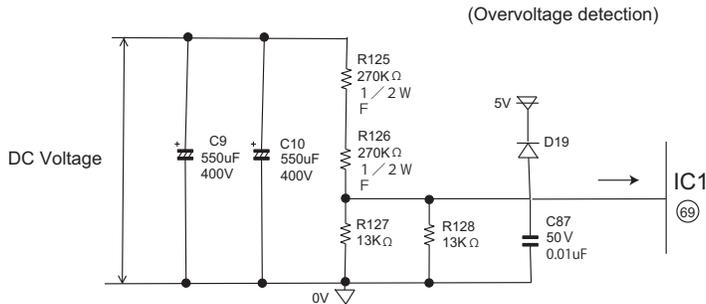

2.2.3 IGBT ON start time (delay time B)

- Based on the zero-cross of the AC voltage, the IGBT turns ON after a delay time set according to the power source frequency.

2.2.4 IGBT ON time (C)

- After the above delay time, the IGBT turns ON to supply a current to the reactor.
- The ON time of the IGBT determines the amount of energy (level of DC voltage rise) supplied to the reactor. DC voltage level in each operation mode (varies depending on external load conditions)
 - Cooling operation --- 260 to 280 V
 - Heating operation --- 260 to 290 V

2.3. PAM protection circuit

To prevent excessive voltage of PAM output from damaging the IPM and electrolytic capacitor as well as the control printed circuit board (PCB), this circuit monitors the PAM output voltage and turns off the PAM control signal and PAM drive immediately when an abnormal voltage output is generated. At the same time, it shuts off the compressor operation.

The protection voltage level is as follows.

2.3.1 Details of troubleshooting procedure for PAM

1) PAM shutdown due to error

- When the DC voltage detection circuit sends a signal exceeding the specified voltage to the microcomputer DC voltage of 400 V or higher (detection circuit input voltage of about 8.4 V or higher) [IC8 pin (4)]
 - When an error is detected
 - PAM IGBT turns OFF.
 - Compressor turns OFF.
 - All units shut down completely when the error occurs four times.
- When the outdoor unit clock waveform differs from the specified value immediately before the PAM IGBT turns ON
 - When there is no clock waveform input
 - When a clock signal of other specified power source frequency (50 Hz) is input
 - When an error is detected
 - PAM IGBT does not turn ON.
 - Compressor operates normally.
 - Complete shutdown does not occur.

2) PAM error indication

In case of error "1)"

- An error signal is sent to the indoor unit as soon as an error is generated.
 - Malfunction No. 14-0 is indicated when the error code is called out by the indoor unit's self-diagnosis function.
- The LED on the outdoor unit flashes 14 times when an error is generated.
 - The LED continues flashing in the 14-time cycle even after the compressor stops operating.
 - The LED turns off (data is deleted from the memory) when the outdoor unit power is turned off.

In case of error "2)"

- An error signal is sent to the indoor unit as soon as an error is judged.
 - Malfunction No. 14-1 is indicated when the error code is called out by the indoor unit's self-diagnosis function.
- The LED on the outdoor unit flashes 14 times when an error is judged.
 - The LED on the outdoor unit flashes in normal pattern when the compressor stops operating.
(Compressor OFF from remote control)

* When a user complains that the air to air heat pump does not provide sufficient cool air or warm air

In addition to conventional error-generating reasons, there is a possibility that the PAM IGBT does not turn ON even if the compressor is operating.

In that case, the DC voltage does not rise even though the compressor is operating.

- Check items
 - Clock circuit check
 - PAM IGBT check
 - Fuse (Fu6) open-circuit check

3. Explanation of IPM drive circuit

The IPM for compressor drive is made by Mitsubishi Electric.

The power supply for the IPM drive and the shunt resistance for overcurrent detection, are provided outside the IPM.

3.1. IPM drive power supply circuit

The power supply for the upper-phase IGBT (HU, HV, HW) drive employs a bootstrap system, and provides power to the upper-phase IC.

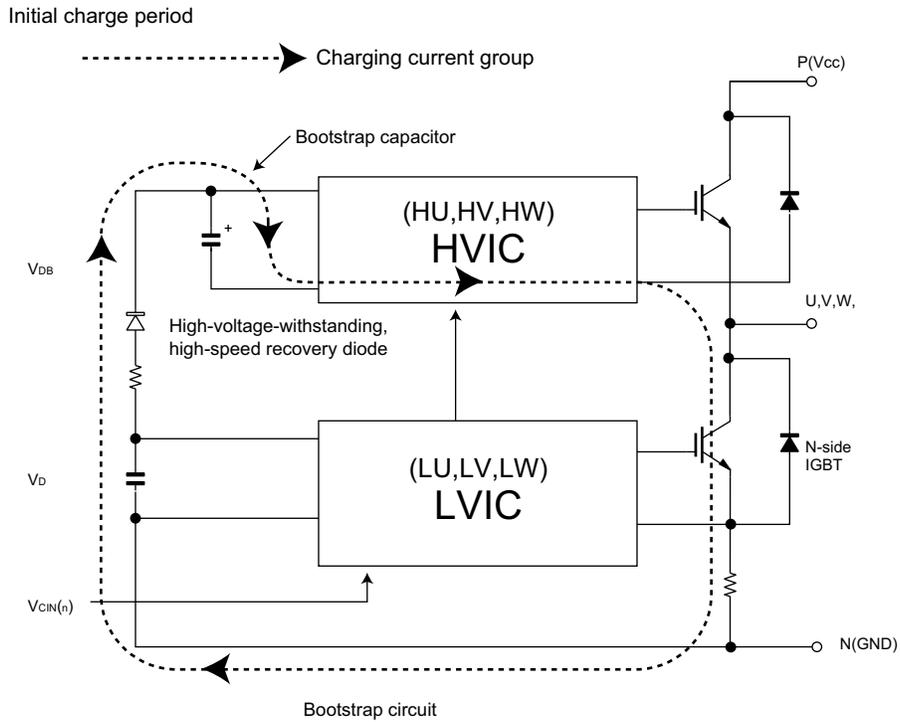

The 15-V power supply for the lower-phase IC is provided by the control printed circuit board (PCB).

3.1.1 Brief explanation of bootstrap system (single power drive system)

To supply power to the upper-phase IC, the microcomputer (IC1) turns ON the lower-phase IGBT (LU, LV, LW).

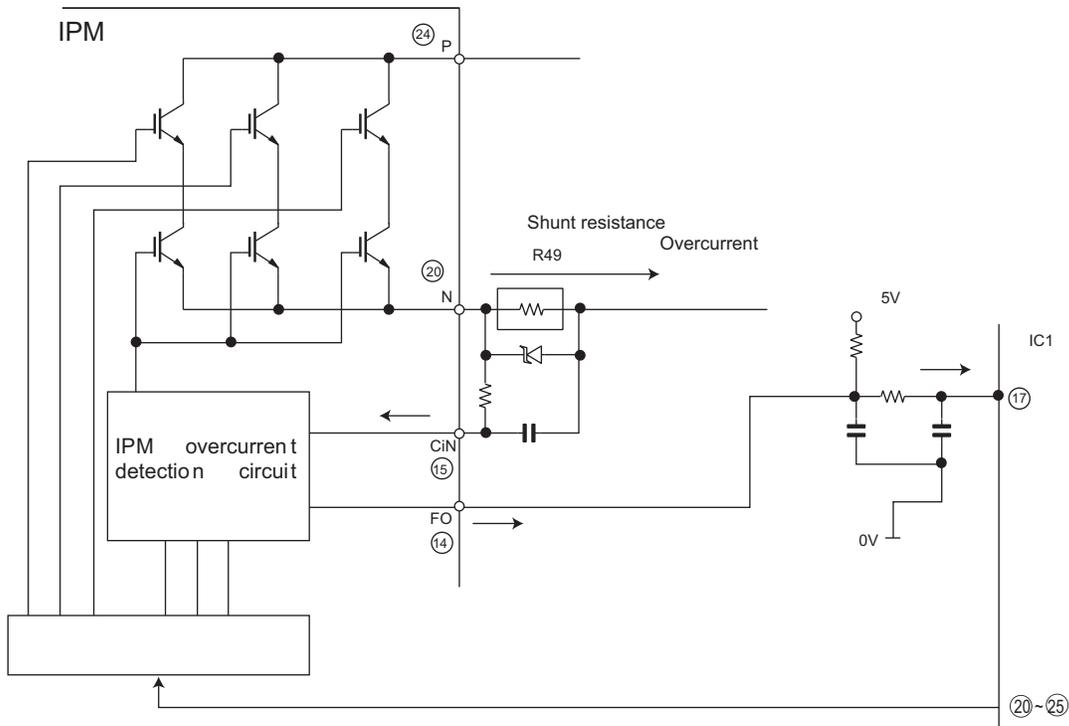

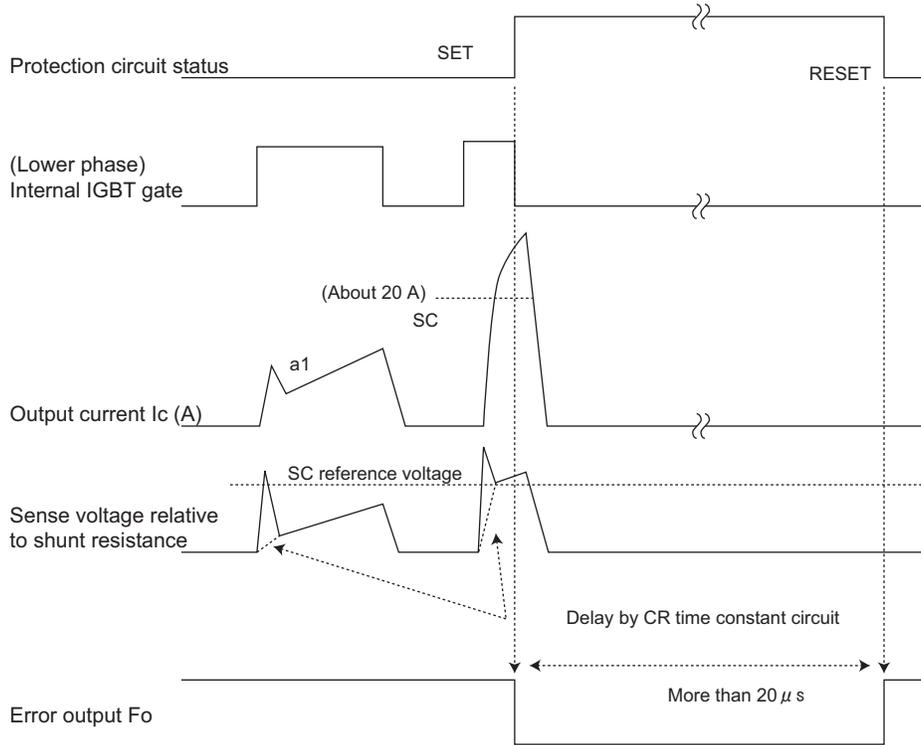

This results in a charging current that flows to the electrolytic capacitor of each upper-phase IC input and charges the bootstrap capacitor with a 15-V current.

The power supply for the subsequent stages is charged while the lower-phase IGBT is ON in ordinary compressor drive control.

3.1.2 DC overcurrent detection circuit

When a current of about 20 A or higher flows through the shunt resistance (R49) on the control printed circuit board (PCB), the voltage at this resistance is input to IPM CIN pin (15). Then, the gate voltage of the lower-phase IGBT (LU, LV, LW) inside the IPM turns OFF to cut off the overcurrent. At the same time, an L output of more than 20 μ s. is generated from IPM Fo pin (14), and this results in an L input to overcurrent detection input pin (17) of the microcomputer (IC1) and turns OFF the PWM signal output (IC1 pins (20) through (25)) to the IGBT gate.

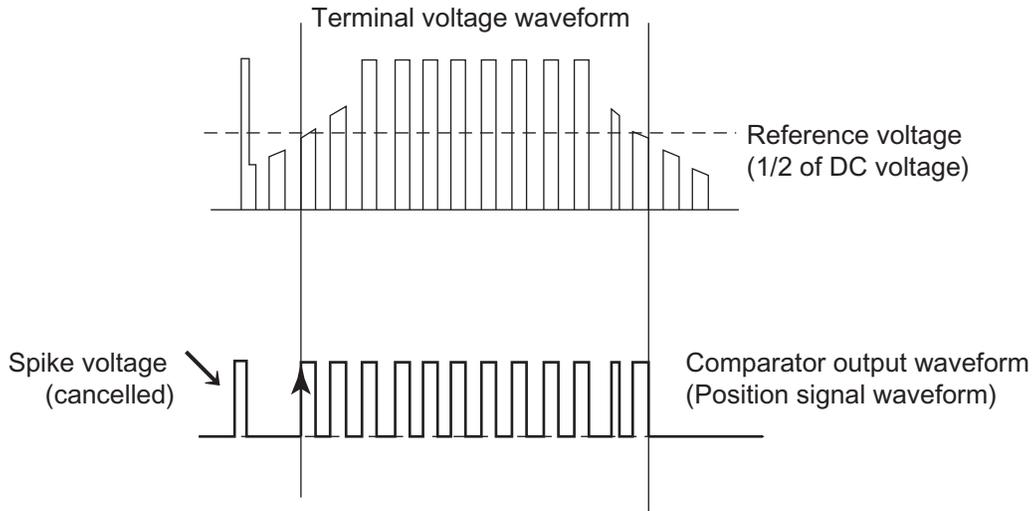

4. 120° energizing control (digital position detection control)

This control system detects the digital position detection signal and adjusts the rate of acceleration/deceleration accordingly.

The motor's induced voltage waveform is input to the comparator in the form of PWM-switched pulse waveform, and a position detection signal is generated as a reference voltage equaling 1/2 of 280 VDC. However, since there is no induced voltage waveform when the PWM waveform is OFF, the microcomputer performs internal processing so that detection is enabled only when it is ON. Based on the detected position signal, actual PWM waveform output timing is determined. Since it does not use a filter circuit, the detection accuracy is high.

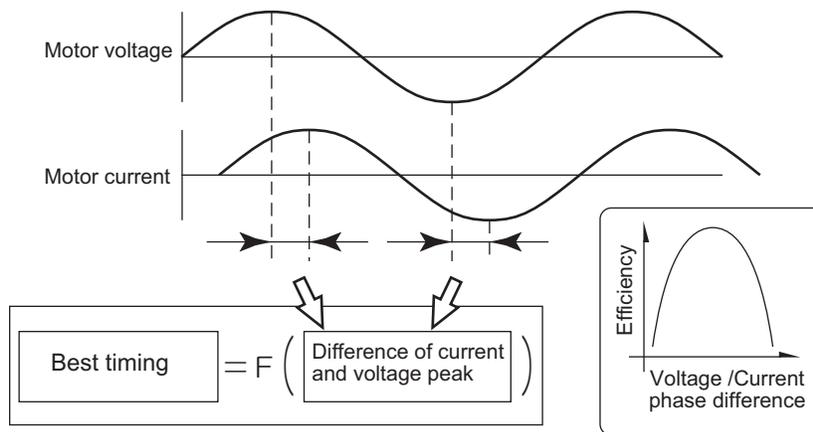

The microcomputer performs internal processing to cancel spike voltage during the regenerative process.

Furthermore, even if the induced voltage is low, position detection is still possible, thus allowing sensor-less operation at low rotation speed in the initial stage of operation. This reduces the starting current and improves the IPM reliability.

5. 180° Energizing Control

This is the control system to moderate the speed by the current phase difference for higher efficiency and lower noise of the compressor. The current phase difference control is the control system paid attention to the interrelation between efficiency and phase gap generated by the applied voltage of motor and current in the coil of motor as shown in the figure below.

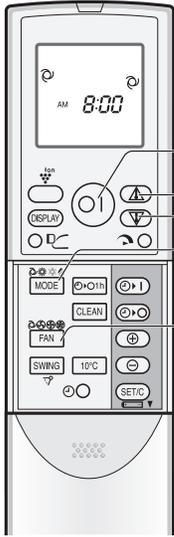

Concept chart of the current phase difference control

This control is the V/F drive system independent of the location of rotor, detecting the phase difference between driving voltage phase and line current phase flowing in motor coil, and controls the modulation rate data to get the phase difference at the best efficiency.

[4] OPERATION MANUAL

BASIC OPERATION

- 1 Press the MODE button to select the operation mode.**
 AUTO HEAT COOL DRY

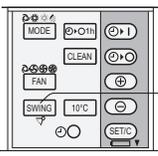

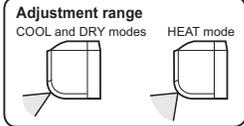

- 2 Press the ON/OFF button to start operation.**
 • The red OPERATION lamp () will light up.
TO TURN OFF
 Press the ON/OFF button again.
 • The red OPERATION lamp () will turn off.
- 3 Press the THERMOSTAT button to set the desired temperature.**
 (AUTO/DRY mode)
 The temperature can be changed up to ±2 °C, the automatically set of temperature. 
 (COOL/HEAT mode)
 The temperature setting range: 18-32 °C. 
- 4 Press the FAN button to set the desired fan speed.**
 AUTO SOFT LOW HIGH

NOTE:
AUTO MODE
 In the AUTO mode, the temperature setting and mode are automatically selected according to the room temperature and outdoor temperature when the unit is turned on. During operation, if the outdoor temperature changes, the temperature settings will automatically change.
DRY MODE
 The fan speed is preset to AUTO and cannot be changed.

ADJUSTING THE AIR FLOW DIRECTION

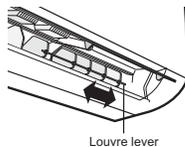

VERTICAL AIR FLOW DIRECTION

- 1 Press the SWING button.**
 • The vertical airflow louvre will swing.
- 2 Press the SWING button again to stop the desired position.**

HORIZONTAL AIR FLOW DIRECTION

Adjust the horizontal air flow direction with the louvre.

Louvre lever

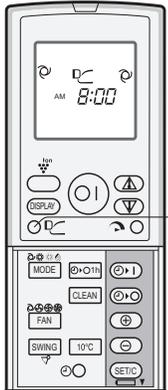

CAUTION:
 Never attempt to adjust the vertical airflow louvre manually.
 • Manual adjustment of the vertical airflow louvre can cause the unit to malfunction.
 • When the vertical adjustment louvre is positioned at the lowest position in the COOL or DRY mode for an extended period of time, condensation may result.

COANDA AIRFLOW

In cool or dry mode, vertical airflow louvre is set obliquely upward to deliver cool air to the ceiling in order to avoid direct airflow. In heat mode, vertical airflow louvre is set downward to deliver the warm air down to the floor.

- 1 During operation, press the COANDA AIRFLOW button.**
 • The remote control will display "  ".

TO CANCEL
 Press the COANDA AIRFLOW button again.

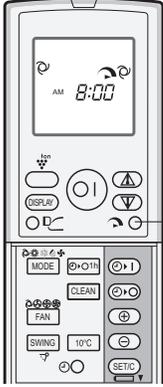

NOTE:
 • If you want COANDA AIRFLOW operation in FULL POWER mode, press COANDA AIRFLOW button during FULL POWER operation.

FULL POWER OPERATION

The air conditioner works at the maximum power to makes the room cool or warm rapidly.

- 1 During operation, press the FULL POWER button.**
 • The remote control will display "  " .
 • The temperature display will go off.
 • The green FULL POWER lamp () will light up.

TO CANCEL
 Press the FULL POWER button again.
 • The green FULL POWER lamp () will turn off.

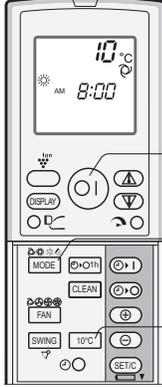

NOTE:
 • The air conditioner will operate at "Extra HIGH" fan speed for 5 minutes, and then shift to "HIGH" fan speed.
 • You can not set the temperature or fan speed during the FULL POWER operation.
 • The FULL POWER operation will be automatically cancelled in one hour, and the unit will return to the original settings. The green FULL POWER lamp () on the unit will turn off.

10°C OPERATION

Heating operation with 10°C set temperature will be performed to protect your home and furniture from frost damage, even when you are out.

- 1 Press the MODE button and select HEAT mode.**
- 2 Press the ON/OFF button to start HEAT operation.**
- 3 Press the 10°C button.**
 • The remote control will display " 10°C " .

TO CANCEL
 Press the 10°C button again.

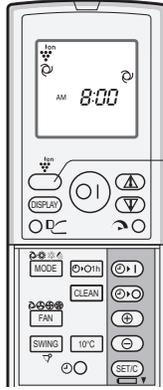

NOTE:
 • 10°C operation will not be available with heating operation automatically selected by AUTO mode.

PLASMACLUSTER OPERATION

Plasmacluster ions released into the room will reduce some airborne mold.

- 1 During operation, press the PLASMACLUSTER button.**
 • The remote control will display "  " .
 • The blue PLASMACLUSTER lamp will light up.

TO CANCEL
 Press the PLASMACLUSTER button again.
 • The blue PLASMACLUSTER lamp will turn off.

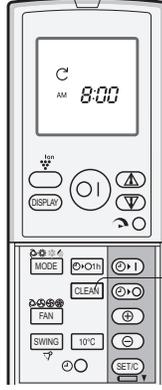

NOTE:
 • Use of the PLASMACLUSTER operation will be memorized, and it will be activated the next time you turn on the unit.
 • To perform Plasmacluster operation in FAN only mode, press the PLASMACLUSTER button when the unit is not operating. The mode symbol of the remote control will go off and the fan speed cannot be set to AUTO.

SELF CLEAN OPERATION

SELF CLEAN operation will reduce the growth mold fungus with Plasmacluster ions and dry inside of the unit. Utilize the operation at seasonal change over terms.

- 1 Press the SELF CLEAN button when the unit is not operating.**
 • The remote control will display "  " .
 • The blue PLASMACLUSTER lamp will light up.
 • The unit will stop operation after 40 minutes.

TO CANCEL
 Press the SELF CLEAN button.
 • The blue PLASMACLUSTER lamp will turn off.

NOTE:
 • You cannot set the temperature, fan speed, air flow direction or timer setting during the SELF CLEAN operation.
 • Mold fungus already grown can not be eliminated by this operation.

1-HOUR OFF TIMER

When the 1-HOUR OFF TIMER is set, the unit will automatically turn off after 1 hour.

1 Press the 1-HOUR OFF TIMER button.

- The remote control will display "00 1h".
- The orange TIMER lamp (🕒) will light up.

TO CANCEL

- Press the SET/C button.
- The orange TIMER lamp (🕒) will turn off.

TIMER OPERATION

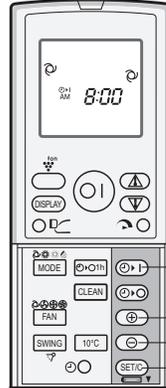

TIMER OFF

- 1 Press the TIMER OFF button.**
 - The TIMER OFF indicator will blink.
- 2 Press the TIME ADVANCE or REVERSE button to set the desired time.**
 - The time can be set in 10-minute increments.
- 3 Press the SET/C button.**
 - The orange TIMER lamp (🕒) will light up.

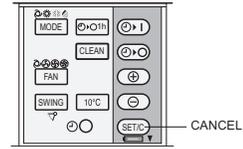

TIMER ON

- 1 Press the TIMER ON button.**
 - The TIMER ON indicator will blink.
- 2 Press the TIME ADVANCE or REVERSE button to set the desired time.**
 - The time can be set in 10-minute increments.
- 3 Press the SET/C button.**
 - The orange TIMER lamp (🕒) will light up.

TO CANCEL

- Press the SET/C button.
- The orange TIMER lamp (🕒) will turn off.
- The current time will be displayed on the remote control.

TO CHANGE TIME SETTING

Cancel the TIMER setting, then set it again

TO COMBINE TIMER ON AND TIMER OFF

Set the TIMER OFF and TIMER ON.

Example
 (Current time: 9:00 p.m.)
 OFF TIMER at 11:00 p.m.
 ON TIMER at 7:00 a.m.

- The arrow (▼ or ▲) between the TIMER ON indicator and the TIMER OFF indicator shows which timer will activate first.

NOTE:

- The 1-HOUR OFF TIMER has priority over TIMER ON and TIMER OFF.
- If the 1-HOUR OFF TIMER is set while the unit is not operating, the unit will operate at the formerly set condition.
- The 1-HOUR OFF TIMER can be extended for an additional hour from the point when 1-HOUR OFF TIMER button is pressed.
- If TIMER ON and/or TIMER OFF are set, TIMER CANCEL button cancels every setting.

NOTE:

- When the TIMER OFF is set, the temperature setting is automatically adjusted to prevent the room from becoming excessively cold or warm, for example while you sleep. (Auto Sleep function)
 COOL mode: One hour after the timer is set, the temperature setting rises by 1 °C.
 HEAT mode: One hour after the timer is set, the temperature setting drops by 3 °C.

NOTE:

- The unit will turn on prior to the set time to allow the room to reach the desired temperature. (Awaking function)

NOTE:

- You cannot program the ON-TIMER and OFF-TIMER to operate the unit at different temperatures or other settings.
- Either timer can be programmed to activate prior to the other.

AUXILIARY MODE

Use this mode when the remote control is not available.

TO TURN ON

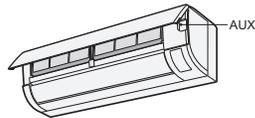

Press the AUX button.

- The red OPERATION lamp (🔴) will light and the unit will start operating in the AUTO mode.
- The fan speed and temperature setting are set to AUTO.

TO TURN OFF

Press the AUX button again.

- The red OPERATION lamp (🔴) will turn off.

DISPLAY BUTTON

Press the DISPLAY button when the lamps on the unit are too bright. (The red OPERATION lamp and the orange TIMER lamp cannot be turned off.)

1 During operation, press the DISPLAY button.

- The blue PLASMACLUSTER lamp and/or the green FULL POWER lamp (🟢) will turn off.

TO LIGHT UP

Press the DISPLAY button again.

CHAPTER 3. FUNCTION AND OPERATION OF PROTECTIVE PROCEDURES

[1] PROTECTION DEVICE FUNCTIONS AND OPERATIONS

Function		Operation				Self-diagnosis result display	
		Description	Detection period	Reset condition	Indoor unit error display	Indoor unit	Outdoor unit
1	Indoor unit fan lock	Operation stops if there is no input of rotation pulse signal from indoor unit fan motor for 1 minute.	When indoor unit fan is in operation	Operation OFF or ON	☆2	Yes	None
	Indoor unit fan rotation speed error	Operation stops if rotation pulse signal from indoor unit fan indicates abnormally low speed (about 300 rpm or slower).	When indoor unit fan is in operation	Operation OFF or ON	☆2	Yes	None
2	Indoor unit freeze prevention	Compressor stops if temperature remains below 0°C for 4 minutes.	When in cooling or dehumidifying operation	Automatic reset when heat exchanger temperature rises above freeze prevention temperature (2°C or higher)	—	None	None
3	2-way valve freeze prevention	Compressor stops if temperature of outdoor unit 2-way valve remains below 0°C for 10 continuous minutes during cooling or dehumidifying operation.	When in cooling or dehumidifying operation	Automatic reset when temperature of 2-way valve rises above 10°C.	None	Yes	Yes
4	Indoor unit heat exchanger overheat shutdown	Operating frequency lowers if indoor unit heat exchanger temperature exceeds overheat temperature during heating operation. Compressor stops if indoor unit heat exchanger temperature exceeds overheat temperature for 60 seconds at minimum frequency. Overheat temperature setting value indoor unit heat exchanger thermistor temperature: about 45 to 54°C	When in heating operation	Automatic reset after safety period (180 sec).	None	Yes	Yes
5	Outdoor unit heat exchanger overheat shutdown	Operation frequency lowers if outdoor unit heat exchanger temperature exceeds about 55°C during cooling operation. Compressor stops if outdoor unit heat exchanger temperature exceeds about 55°C for 120 seconds at minimum frequency.	When in cooling or dehumidifying operation	Automatic reset after safety period (180 sec).	None	Yes	Yes
6	Compressor discharge overheat shutdown	Operating frequency lowers if temperature of compressor chamber thermistor (TH1) falls below about 110°C. Compressor stops if temperature of compressor chamber thermistor (TH1) remains at about 110°C (for 120 seconds in cooling operation, or 60 seconds in heating operation) at minimum frequency.	When compressor is in operation	Automatic reset after safety period (180 sec).	None	Yes	Yes
7	Dehumidifying operation temporary stop	Compressor stops if outside air temperature thermistor is lower than about 16°C during dehumidifying operation.	When in dehumidifying operation	Automatic reset when outside air temperature rises above 16°C.	None	Yes	Yes
8	DC overcurrent error	Compressor stops if DC current of about 25 A or higher flows in IPM.	When compressor is in operation	Operation OFF or ON	Yes ☆1	Yes	Yes
9	AC overcurrent error	Operating frequency lowers if outdoor AC current exceeds peak control current value. outdoor stops if compressor AC current exceeds peak control current value at minimum frequency.	When compressor is in operation	Operation OFF or ON	Yes ☆1	Yes	Yes

Function		Operation				Self-diagnosis result display	
		Description	Detection period	Reset condition	Indoor unit error display	Indoor unit	Outdoor unit
10	AC overcurrent error in compressor OFF status	Indoor and outdoor units stop if outdoor AC current exceeds about 3 A while compressor is in non-operation status.	When compressor is in non-operation	Replacement of defective parts such as IPM	Yes ☆2	Yes	Yes
11	AC maximum current error	Compressor stops if outdoor AC current exceeds 17 A.	When compressor is in operation	Operation OFF or ON	Yes ☆1	Yes	Yes
12	AC current deficiency error	Compressor stops if operating frequency is 50 Hz or higher and outdoor AC current is about 2.0 A or lower.	When compressor is in operation	Operation OFF or ON	Yes ☆1	Yes	Yes
13	Thermistor installation error or 4-way valve error	Compressor stops if high and low values of temperatures detected by outdoor unit heat exchanger thermistor (TH2) and 2-way valve thermistor (TH5) do not match operating cycle.	3 minutes after compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
14	Compressor high temperature error	Compressor stops if compressor chamber thermistor (TH1) exceeds about 114°C, or if there is short-circuit in TH1.	When in operation	Operation OFF or ON	Yes ☆1	Yes	Yes
15	Outdoor unit heat exchanger thermistor short-circuit error	Compressor stops if there is short-circuit in outdoor unit heat exchanger thermistor (TH2).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
16	Outdoor unit outside air temperature thermistor short-circuit error	Compressor stops if there is short-circuit in outdoor unit outside air temperature thermistor (TH3).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
17	Outdoor unit suction thermistor short-circuit error	Compressor stops if there is short-circuit in outdoor unit suction thermistor (TH4).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
18	Outdoor unit 2-way valve thermistor short-circuit error	Compressor stops if there is short-circuit in outdoor unit 2-way valve thermistor (TH5).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
19	Outdoor unit heat exchanger thermistor open-circuit error	Compressor stops if there is open-circuit in outdoor unit heat exchanger thermistor (TH2).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
20	Outdoor unit outside air temperature thermistor open-circuit error	Compressor stops if there is open-circuit in outdoor unit outside air temperature thermistor (TH3).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
21	Outdoor unit suction thermistor open-circuit error	Compressor stops if there is open-circuit in outdoor unit suction thermistor (TH4).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
22	Outdoor unit 2-way valve thermistor open-circuit error	Compressor stops if there is open-circuit in outdoor unit 2-way valve thermistor (TH5).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
23	Outdoor unit discharge thermistor open-circuit error	Compressor stops if there is open-circuit in outdoor unit discharge thermistor (TH1).	At compressor startup	Operation OFF or ON	Yes ☆1	Yes	Yes
24	Serial signal error	Compressor stops if outdoor unit cannot receive serial signal from indoor unit for 30 seconds.	When in operation	Reset after reception of serial signal	None	None	None
25	Compressor startup error	Compressor stops if compressor fails to start up.	At compressor startup	Operation OFF or ON	Yes ☆3	Yes	Yes
26	Compressor rotation error (at 120° energizing)	Compressor stops if there is no input of position detection signal from compressor or input is abnormal.	Compressor operating at 120° energizing	Operation OFF or ON	Yes ☆3	Yes	Yes
27	Outdoor unit DC fan error	Operation stops if there is no input of rotation pulse signal from outdoor unit fan motor for 30 seconds.	When outdoor unit fan is in operation	Operation OFF or ON	Yes ☆1	Yes	Yes
28	PAM overvoltage error	Compressor stops if DC voltage is 400 V or higher.	When in operation	Operation OFF or ON	Yes ☆1	Yes	Yes

Function		Operation				Self-diagnosis result display	
		Description	Detection period	Reset condition	Indoor unit error display	Indoor unit	Outdoor unit
29	PAM clock error	When power source frequency cannot be determined (at startup), or when power source clock cannot be detected for 1 continuous second (at startup).	At compressor startup, when in operation	Compressor continues operation without stopping.	None	Yes	Yes

☆1—The outdoor unit restarts four times before the indoor unit error is displayed (complete shutdown).

☆2—A single error judgment results in the display of the indoor unit error (complete shutdown).

☆3—The outdoor unit restarts eight times before the indoor unit error is displayed (complete shutdown).

[2] AIR TO AIR HEAT PUMP OPERATION IN THERMISTOR ERROR

1. Indoor unit

Item	Mode	Control operation	When resistance is low (temperature judged higher than actual)	Short-circuit	When resistance is high (temperature judged lower than actual)	Open-circuit
Room temperature thermistor (TH1)	Auto	Operation mode judgment	Cooling mode is activated even if room temperature is low.	Cooling mode is activated in most cases.	Heating mode is activated even if room temperature is high.	Heating mode is always activated.
	Cooling	Frequency control	Room becomes too cold.	Air conditioner operates in full power even when set temperature is reached.	Room does not become cool.	Compressor does not operate.
	Dehumidifying	Room temperature memory Frequency control	Normal operation.	Room temperature is stored in memory as 31.0°C, and compressor does not stop.	Normal operation.	Room temperature is stored in memory as 18.5°C, and compressor does not operate.
	Heating	Frequency control	Room does not become warm.	Hot keep status results immediately after operation starts. Frequency does not increase above 30 Hz (40 Hz).	Room becomes too warm.	Air conditioner operates in full power even when set temperature is reached.
Heat exchanger thermistor (TH2)	Cooling Dehumidifying	Freeze prevention	Indoor unit evaporator may freeze.	Indoor unit evaporator may freeze.	Compressor stops occasionally.	Compressor does not operate.
	Heating	Cold air prevention	Cold air prevention deactivates too soon and cold air discharges.	Compressor operates at low speed or stops, and frequency does not increase.	Cold air prevention deactivates too slow.	Cold air prevention does not deactivate, and indoor unit fan does not rotate.

2. Outdoor unit

Item	Mode	Control operation	When resistance is low (temperature judged higher than actual)	Short-circuit	When resistance is high (temperature judged lower than actual)	Open-circuit
Compressor chamber thermistor (TH1)	Cooling Dehumidifying Heating	Expansion valve control and compressor protection	Compressor operates, but room does not become cool or warm (expansion valve is open).	Compressor high temperature error indication.	Layer short-circuit or open-circuit may result in compressor in normal operation.	Outdoor unit thermistor open-circuit error indication.
Heat exchanger thermistor (TH2)	Cooling Dehumidifying	Outdoor unit heat exchanger over-heat prevention	Compressor operates at low speed or stops.	Outdoor unit thermistor short-circuit error indication.	Normal operation.	Outdoor unit thermistor open-circuit error indication.
	Heating	Expansion valve control Defrosting	Defrosting operation is not activated as needed, and frost accumulates on outdoor unit (expansion valve is closed).	Outdoor unit thermistor short-circuit error indication.	Defrosting operation is activated unnecessarily, and room does not become warm (expansion valve is open).	Outdoor unit thermistor open-circuit error indication.
Outside air temperature thermistor (TH3)	Auto	Operation mode judgment	Cooling mode is activated even if room temperature is low.	Outdoor unit thermistor short-circuit error indication.	Heating mode is activated even if room temperature is high.	Outdoor unit thermistor open-circuit error indication.
	Cooling Dehumidifying	Operation not affected	Normal operation.	Outdoor unit thermistor short-circuit error indication.	Normal operation.	Outdoor unit thermistor open-circuit error indication.
	Heating	Rating control Defrosting	Defrosting operation is activated unnecessarily.	Outdoor unit thermistor short-circuit error indication.	Defrosting operation is not activated, and frost accumulates on outdoor unit.	Outdoor unit thermistor open-circuit error indication.
Suction pipe thermistor (TH4)	Cooling Dehumidifying	Expansion valve control	Compressor operates, but room does not become cool (expansion valve is open).	Outdoor unit thermistor short-circuit error indication.	Frost accumulates on evaporator inlet section, and room does not become cool (expansion valve is closed).	Outdoor unit thermistor open-circuit error indication.
	Heating	Expansion valve control	Compressor operates, but room does not become warm (expansion valve is open).	Outdoor unit thermistor short-circuit error indication.	Frost accumulates on expansion valve outlet section, and room does not become warm (expansion valve is closed).	Outdoor unit thermistor open-circuit error indication.
2-way valve thermistor (TH5)	Cooling Dehumidifying	Expansion valve control	Frost accumulates on indoor unit evaporator and room does not become cool (expansion valve is closed).	Outdoor unit thermistor short-circuit error indication.	Compressor operates, but room does not become cool (expansion valve is open).	Outdoor unit thermistor open-circuit error indication.
	Heating	Operation not affected	Normal operation.	Outdoor unit thermistor short-circuit error indication.	Normal operation.	Outdoor unit thermistor open-circuit error indication.

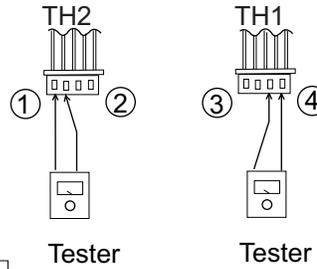

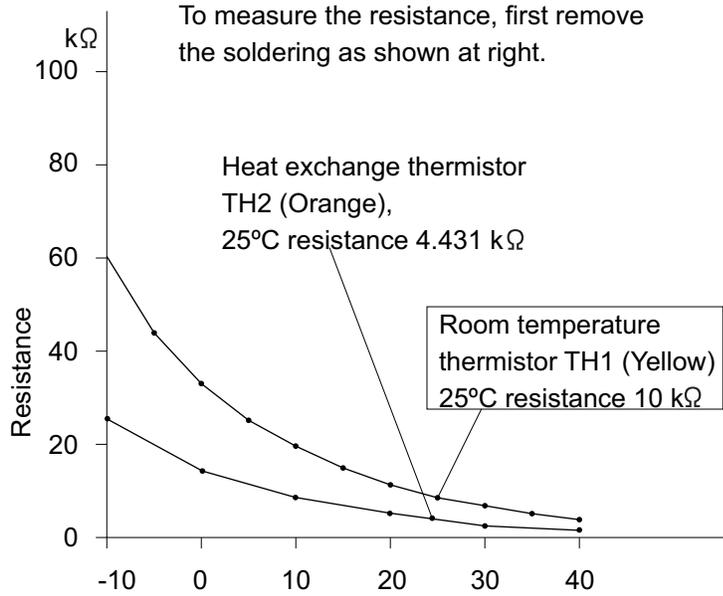

[3] THERMISTOR TEMPERATURE CHARACTERISTICS

1. Indoor unit thermistor temperature characteristics

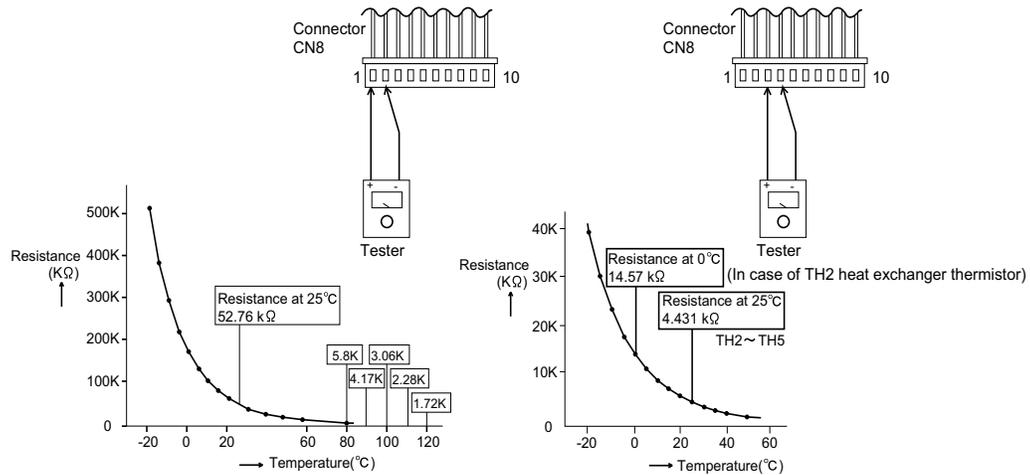

Figure 1 Temperature properties of indoor thermistors

Thermistor	Signal	Color
Room temperature	TH1	Yellow
Heat exchange	TH2	Orange

Room temperature thermistor TH1 (CN8 ③ - ④)
Heat exchange thermistor TH2 (CN8 ① - ②)

2. Outdoor unit thermistor temperature characteristics

TH1 Compressor thermistor

- TH2 Heat exchanger thermistor
- TH3 Outdoor air temperature thermistor
- TH4 Suction thermistor
- TH5 2-way valve thermistor

Thermistor	No.	Connector	Color
Compressor thermistor	TH1	No. (1) - No. (2)	Red
Heat exchanger thermistor	TH2	No. (3) - No. (4)	Orange
Outdoor air temperature thermistor	TH3	No. (5) - No. (6)	Green
Suction thermistor	TH4	No. (7) - No. (8)	Black
2-way valve thermistor	TH5	No. (9) - No. (10)	Yellow

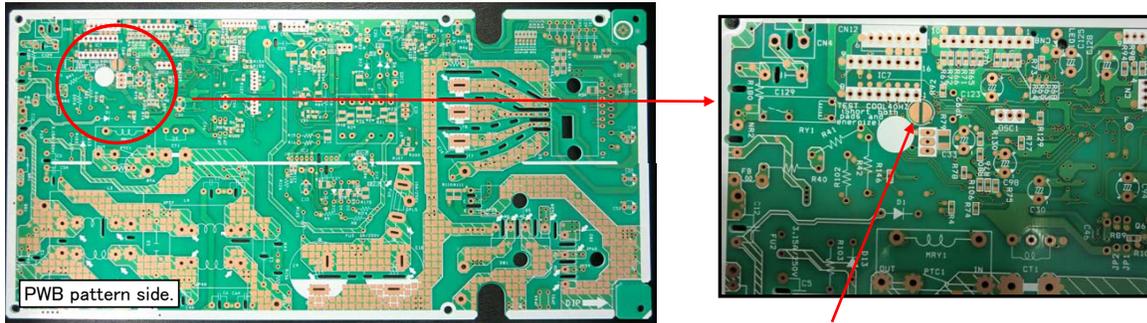

Before measuring resistance, disconnect connectors from PWB.

[4] HOW TO OPERATE THE OUTDOOR UNIT INDEPENDENTLY

1. Cooling in 40 Hz fixed mode

To operate the outdoor unit independently, short-circuit the sections indicated by arrows in the diagram below with an adapter, and apply 220-240 VAC between (1) and (N) on the terminal board of the outdoor unit. This allows the outdoor unit to be operated in cooling mode independently.

(Do not operate the outdoor unit in this condition for an extended period of time.)

Short both pads and energize.

[5] GENERAL TROUBLESHOOTING CHART

1. Indoor unit does not turn on

Main cause	Inspection method	Normal value/condition	Remedy
Cracked PWB. (Cracked pattern)	Check visually.	There should be no cracking in PWB or pattern.	Replace PWB.
Open-circuit in FU1 (250 V, 3.15 A)	Check melting of FU1.	There should be no open-circuit.	Replace PWB.

2. Indoor unit fan does not operate

Main cause	Inspection method	Normal value/condition	Remedy
Open-circuit in heat exchanger thermistor (TH2) (in heating operation)	Measure thermistor resistance (dismount for check).	CN8(1)-(2)	Replace thermistor.
		There should be no open-circuit or faulty contact.	Replace thermistor.
Disconnected heat exchanger thermistor (TH2) (in heating operation)	Inspect connector on PWB. Check thermistor installation condition.	Thermistor should not be disconnected.	Install correctly.

3. Indoor unit fan speed does not change

Main cause	Inspection method	Normal value/condition	Remedy
Remote control is not designed to allow fan speed change in several operation mode.	Check operation mode.	Fan speed should change except during dehumidifying operation, ventilation, light dehumidifying operation, internally normal operation	Explain to user.

4. Remote control signal is not received

Main cause	Inspection method	Normal value/condition	Remedy
Batteries at end of service life.	Measure battery voltage.	2.5 V or higher (two batteries in series connection)	Install new batteries.
Batteries installed incorrectly.	Check battery direction.	As indicated on battery compartment.	Install batteries in indicated direction.
Lighting fixture is too close, or Fluorescent lamp is flickering in the room.	Turn off light and check.	Signal should be received when light is turned off.	Change light position or install new fluorescent lamp.
Sevick light (Hitachi) is used in the room.	Check room lights.	Signal may not be received sometimes due to effect of Sevick light.	Replace light or change position.
Operating position/angle are inappropriate.	Operate within range specified in manual.	Signal should be received within range specified in manual.	Explain appropriate handling to user.

Main cause	Inspection method	Normal value/condition	Remedy
Open-circuit or short-circuit in wiring of light receiving section.	Check if wires of light receiving section are caught.	Wires of light receiving section should not have any damage caused by pinching.	Replace wires of light receiving section.
Light receiving unit is defective	Check signal receiving circuit (measure voltage between terminals 8 and 10, 9 and 10 of connector CN17).	Tester indicator should move when signal is received.	Replace PWB.
Dew condensation on light receiving unit.	Check for water and rust.	Signal should be received within range specified in manual.	Take moisture-proof measure for lead wire outlet of light receiving section.

5. Louvers do not move

Main cause	Inspection method	Normal value/condition	Remedy
Caught in sliding section.	Operate to see if louvers are caught in place.	Louvers should operate smoothly.	Remove or correct catching section.
Disconnected connector (CN7) on PWB,	Inspect connectors.	Connectors or pins should not be disconnected.	Install correctly.
Contact of solder on PWB (connector section on PWB)	Check visually.	There should not be solder contact.	Correct contacting section.

6. There is noise in TV/radio

Main cause	Inspection method	Normal value/condition	Remedy
Grounding wires not connected properly.	Check grounding wire connections.	Grounding wires should be connected properly.	Connect grounding wires properly.
TV/radio is placed too close to outdoor unit.	Check distance between TV/radio and outdoor unit.	If TV/radio is placed too close, it may become affected by noise.	Move TV/radio away from outdoor unit.
Other than above.	Check for radio wave interference.		

7. Malfunction occurs

Main cause	Inspection method	Normal value/condition	Remedy
Malfunction caused by noise.	Check for radio wave interference.		

8. Compressor does not start

Main cause	Inspection method	Normal value/condition	Remedy
Erroneous inter-unit connection.	Check wiring between indoor and outdoor units.	Terminal board 1-N: 220-240 VAC, 50 Hz Terminal board 2: serial signal	Correct wiring.
Damaged IPM.	Check IPM continuity.	See [IPM check method] on page 3-10	Replace IPM.
Dried-up electrolytic capacitor.	Check electrolytic capacitor.	See [Inverter electrolytic capacitor (C9,C10) check method] on page 3-9	Replace electrolytic capacitor.
Blown outdoor unit fuse.	Check 20A fuse. Check 15A fuse.	Fuse should not be blown.	Replace fuse/diode bridge. Replace fuse. Replace outdoor unit PWB assembly.
Power supply voltage is too low.	Measure power supply voltage during startup.	230±10 VAC, 50 Hz	Make sure that power supply voltage is 200 V or higher.
Compressor lock. •Temp. fuse of terminal is error •EEPROM error •AC Over current error	Supply current and touch compressor cover (sound absorbing material) to check if operation starts. See (Diagnosis Function and display mode) on page 3-13	Compressor should start normally. Malfunction display section (0-0) Compressor should start normally.	Apply external impact to compressor. Replace compressor. •Replace terminal •Replace outdoor unit PWB •Replace outdoor unit PWB

9. Operation stops after a few minutes and restarts, and this process repeats

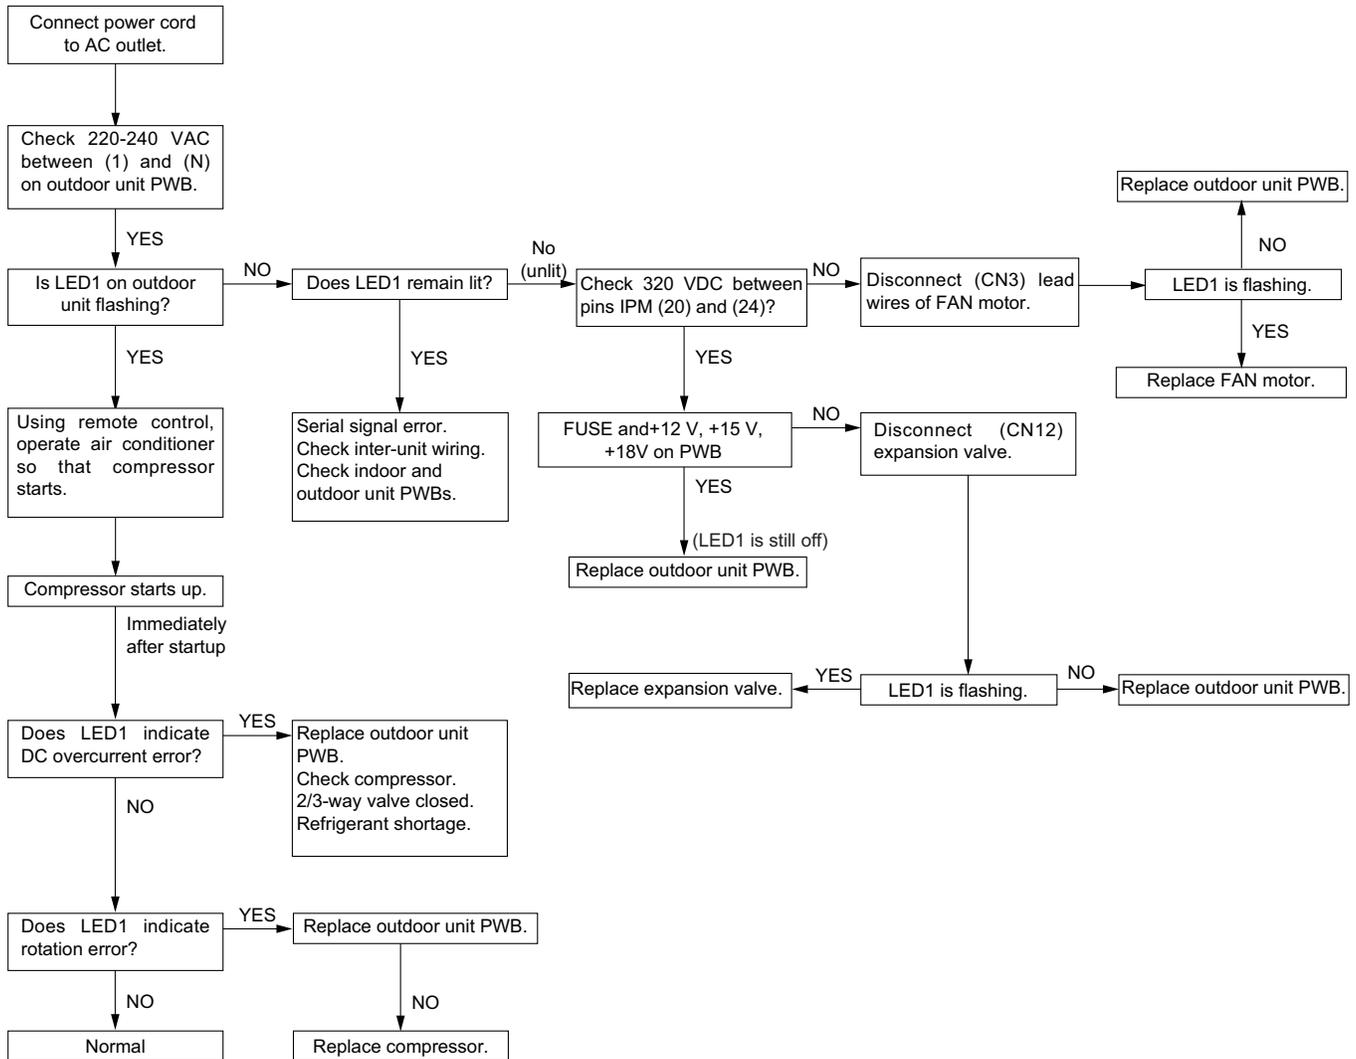

Main cause	Inspection method	Normal value/condition	Remedy
Dried-up electrolytic capacitor.	Measure 320VDC line voltage.	300 V or higher.	Replace electrolytic capacitor.
Layer short-circuit in expansion valve coil.	Measure resistance.	46±3Ω in each phase (at 20°C)	Replace coil.

CAUTION: If fuse FU1/FU4/FU5 (outdoor unit control circuit board) is blown, be careful of charging voltage in inverter electrolytic capacitor C9, C10.
 To discharge stored electricity, unplug the power cord and connect the plug of a soldering iron (230VAC, 50W) between the positive and negative terminals of inverter electrolytic capacitor C9, C10.

[6] MALFUNCTION (PARTS) CHECK METHOD

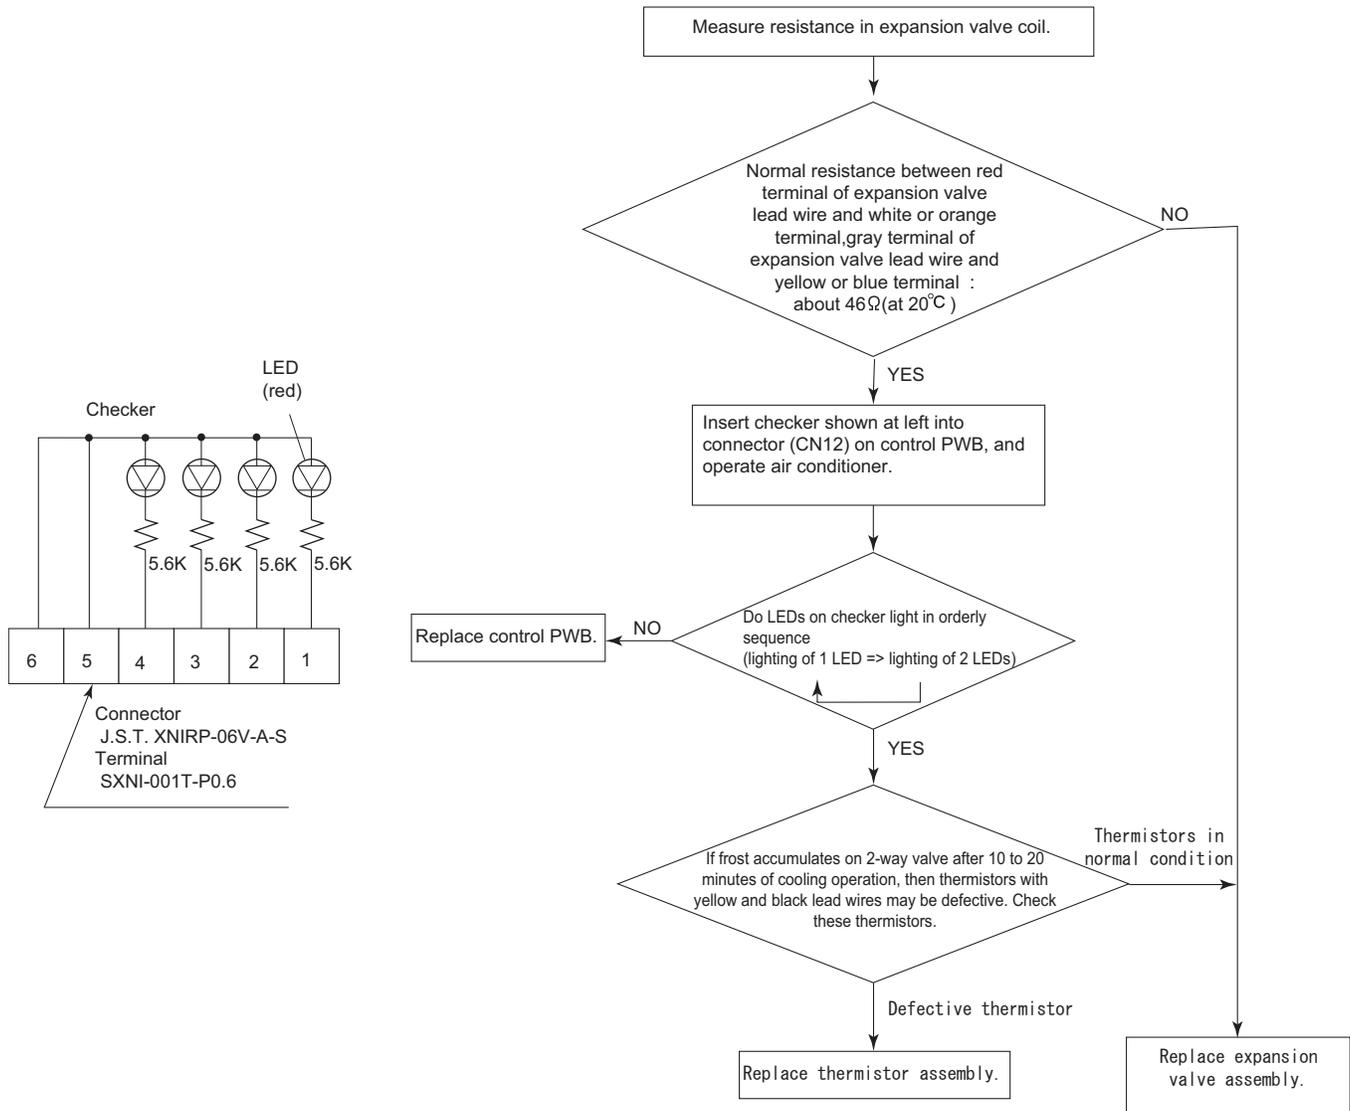

1. Procedure for determining defective outdoor unit IPM/compressor

The following flow chart shows a procedure for locating the cause of a malfunction when the compressor does not start up and a DC overcurrent indication error occurs.

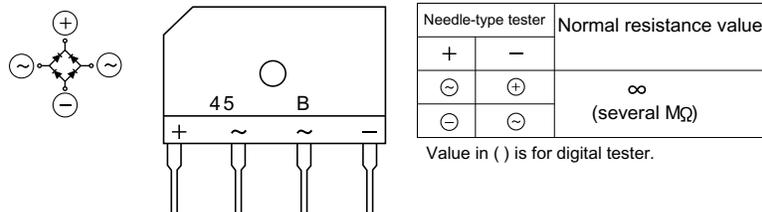

CAUTION: Please take care for electrical shock when you work to change defective parts or disconnect wires of defective application.
 The outdoor unit has energy changed for a while even after unplugging the power supply cord.
 After changing the part or unit, please retry check procedure from the beginning.

2. Procedure for determining defective expansion valve

3. Diode bridge check method

Turn off the power and let the inverter electrolytic capacitor (C9, C10) discharge completely. Then use a tester and check continuity. When using a digital tester, the (+) and (-) tester lead wires in the table must be reversed.

4. Inverter electrolytic capacitor (C9, C10) check method

Turn off the power, let the inverter electrolytic capacitor (C9, C10) discharge completely, and remove the capacitor from the control printed circuit board (PWB). First, check the case for cracks, deformation and other damages. Then, using a needle-type tester, check continuity.

Determination of normal condition
The tester needle should move on the scale and slowly returns to the original position. The tester needle should move in the same way when polarities are reversed. (When measurement is taken with the polarities reversed, the tester needle exceeds the scale range. Therefore, let the capacitor discharge before measurement.)

5. IPM check method

Turn off the power, let the large capacity electrolytic capacitor (C10) discharge completely, and dismount the IPM. Then, using a tester, check leak current between C and E.

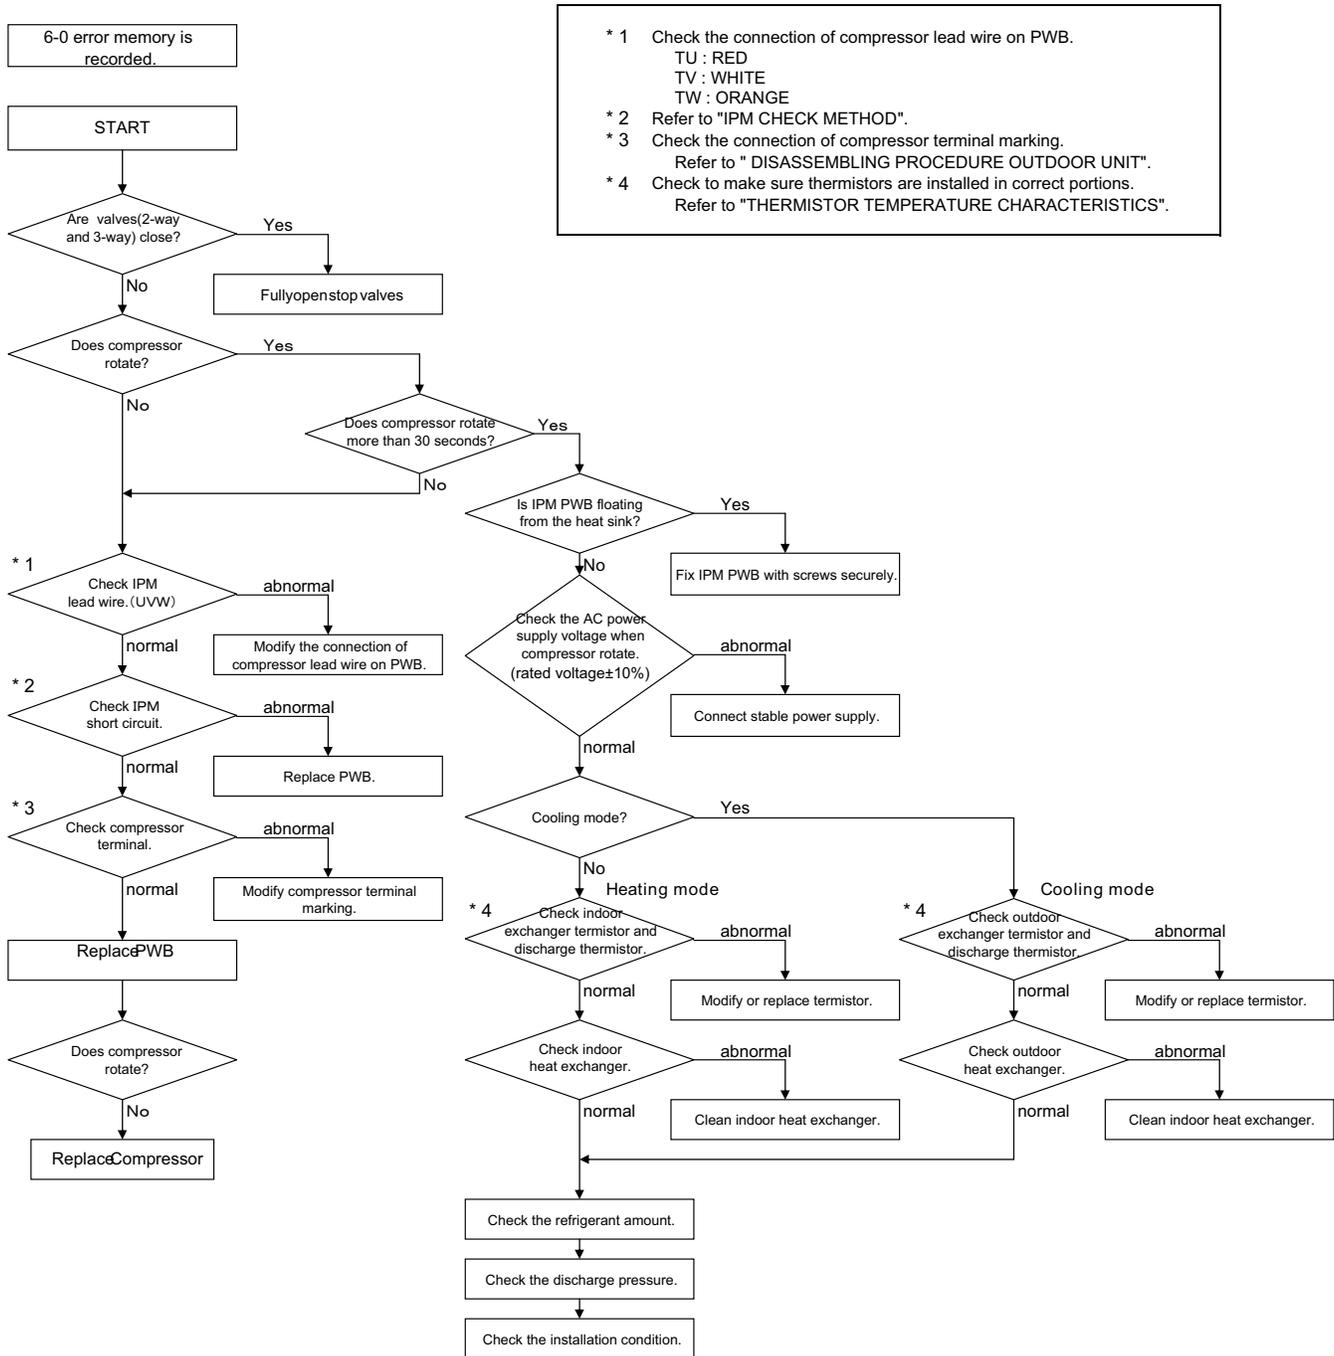

When using a digital tester, the (+) and (-) tester lead wires in the table must be reversed.

Needle-type tester		Normal resistance value
(-)	(+)	
P	N	∞ (several M Ω)
	U	
	V	
	W	

Needle-type tester		Normal resistance value
(-)	(+)	
U	N	∞ (several M Ω)
V		
W		

Values in () are for digital tester.

6. DC Over Current Error (6-0 error)

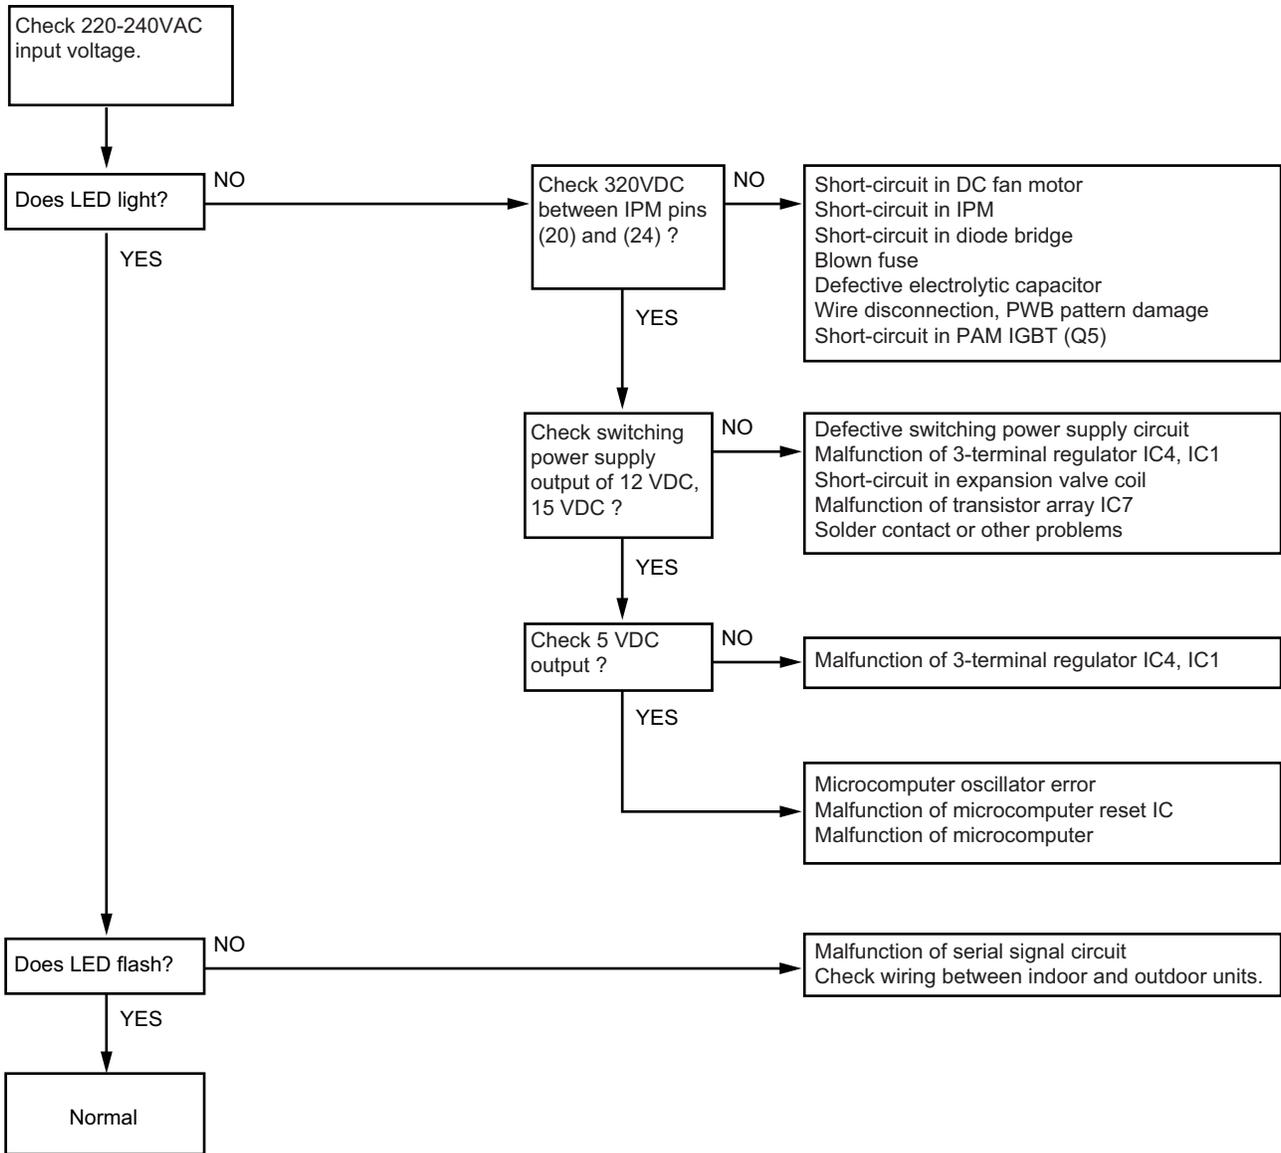

[7] OUTDOOR UNIT CHECK METHOD

After repairing the outdoor unit, conduct the following inspection procedures to make sure that it has been repaired completely. Then, operate the compressor for a final operation check.

1. Checking procedures

No.	Item	Check method	Normal value/condition	Remedy
1	Preparation	Disconnect compressor cords (white, orange, red: 3 wires) from compressor terminals, and connect simulated load (lamp used as load). Operate air conditioner in cooling or heating test operation mode.		
2	Inverter DC power supply voltage check	Measure DC voltage between IPM pins (20) and (24).	320 VDC	Replace control PWB. Replace diode bridge. Correct soldered section of Fasten tabs (BT1,2,5,6,10,11, JPL1,2,5,6) on control PWB. (Repair solder cracks.)
3	IPM circuit check	Check that 3 lamps (load) light. Check position detection voltage (+15 V, 5 V) on control PWB.	Each voltage should be normal. All 3 lamps (load) should light with same intensity.	Replace control PWB.
4	Compressor check	Measure compressor coil resistance (for each phase of U, V and W). Use multi-meter or digital tester capable of displaying two digits right of the decimal point (0.01Ω).	Resistance value at 20°C --- 0.65Ω	Correct connections at compressor terminals. Replace compressor.
5	Expansion valve check	Measure expansion valve coil resistance.	Each phase 46±3Ω (at 20°C)	Replace expansion valve.
6	Final check	Turn off power, and connect compressor cords to compressor. Operate air conditioner. Measure DC voltage between IPM pins (20) and (24).	Compressor should operate normally. 320 VDC or higher.	Replace control PWB. Replace outdoor unit thermistor. Replace compressor (in case of compressor lock).

2. Troubleshooting of outdoor unit electric components

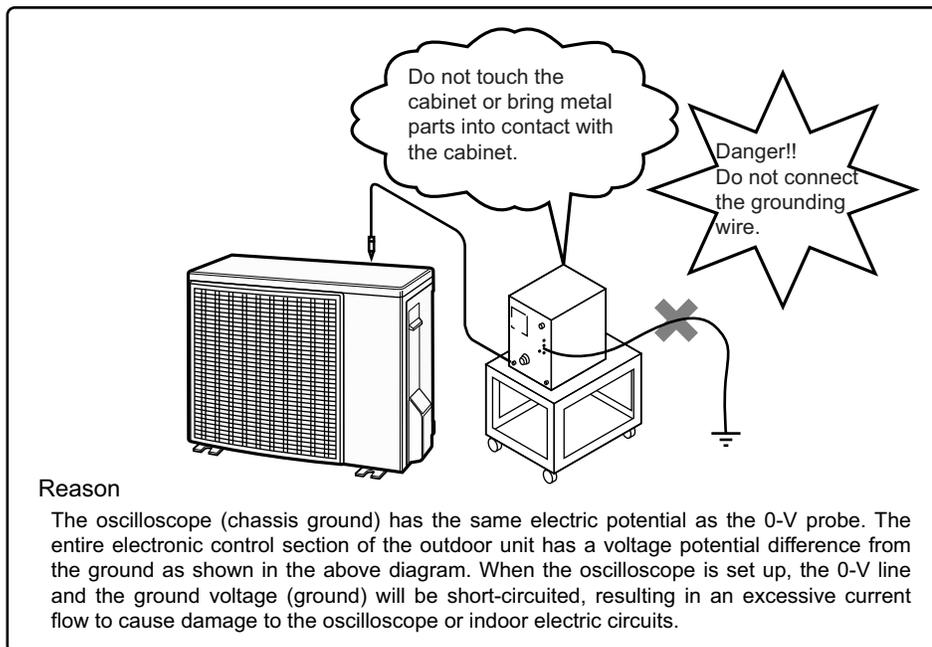

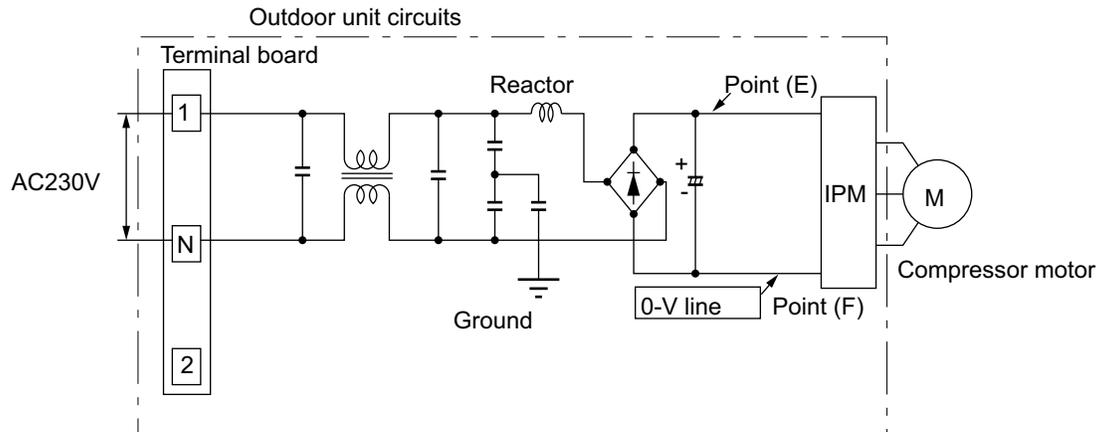

3. Caution in checking printed circuit boards (PWB)

3.1. Non-insulated control circuit

The GND terminals of the low-voltage circuits (control circuits for microcomputer and thermistors and drive circuits for expansion valve and relays) on the control printed circuit board (PWB) are connected to the compressor drive power supply (320-VDC negative terminal). Therefore, exercise utmost caution to prevent electric shock.

If a measuring instrument used for the test is grounded, its chassis (ground) has the same electric potential as the 0-V probe. Since non-insulated circuits have the following voltage potential difference from the ground, connection of the grounding wire results in a short-circuit between the 0-V line and the ground, thus allowing an excessive current to flow to the tester to cause damage.

If the sheaths of the thermistor lead wires or expansion valve lead wires inside the outdoor unit become damaged due to pinching by the front panel or other metal parts or contacting a pipe, a high voltage can flow and destroy the circuits. To prevent these problems, carefully conduct assembly work.

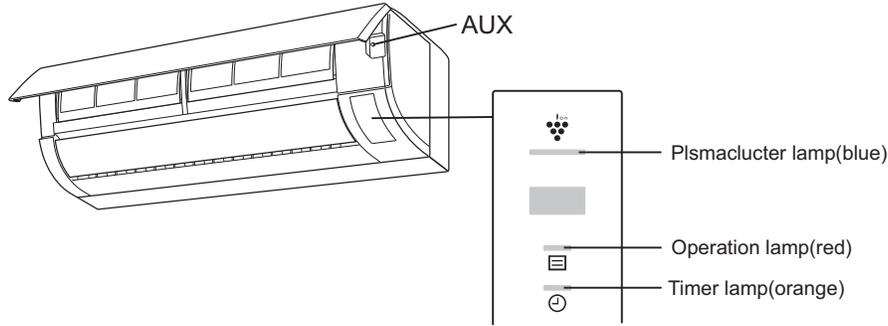

[8] TROUBLESHOOTING GUIDE

1. Self-Diagnosis Function

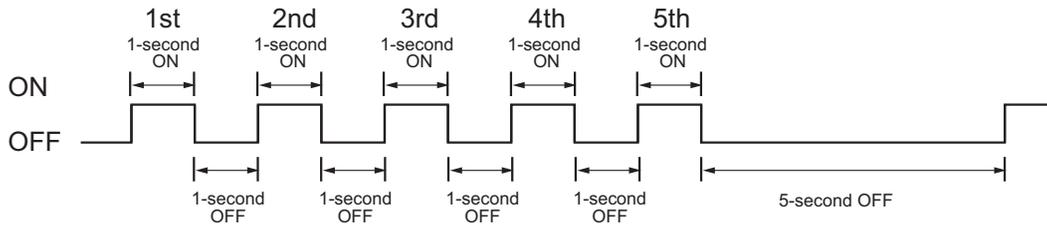

1. Indoor unit

- To display the self-diagnosis, hold down the AUX button for over 5 seconds on the indoor unit when the indoor unit is not operating.
- The operation lamp (red), timer lamp (orange) and Plasmacluster lamp (blue) flash to indicate the information of malfunction.
- If the power cord is unplugged or the circuit breaker is turned off, the self-diagnosis memory is lost.

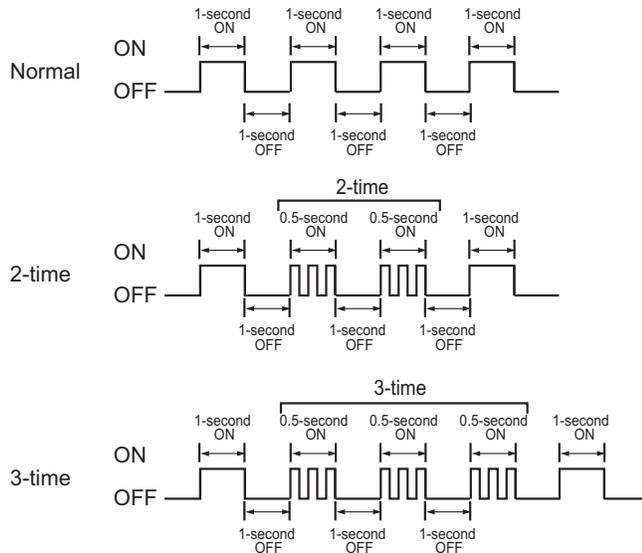

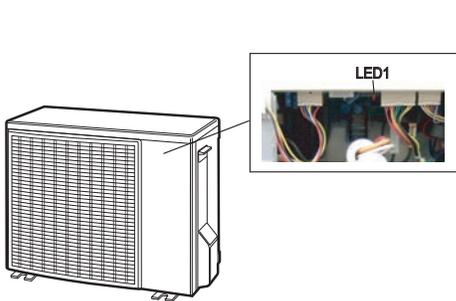

(Display of self-diagnosis result)

The operation lamp (red) and the Plasmacluster lamp (blue) flash in synchronization with the timer lamp (orange).

2. Outdoor unit

- The self-diagnosis is indicated the error information by flashing LED1 on the outdoor unit.
- The self-diagnosis of outdoor unit is displayed for about 3-10 minutes. Then, the LED1 returns to normal display.

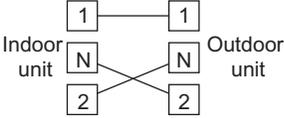

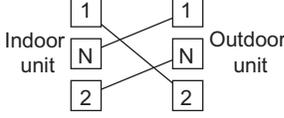

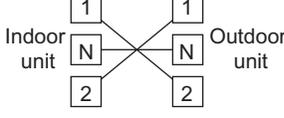

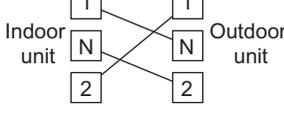

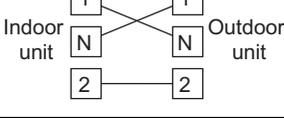

Problem symptom	Outdoor unit indication (LED1)	Indoor unit				Malfunction No.		Content of diagnosis		Check point	Action

5		Malfunction diagnosis display "18-1"

CHAPTER 4. REFRIGERATION CYCLE

[1] FLOW FOW REFRIGERANT

[2] STANDARD CONDITION

	Indoor side		Outdoor side	
	Dry-bulb Temp. (°C)	Relative Humidity (%)	Dry-bulb Temp. (°C)	Relative Humidity (%)
Cooling	27	47	35	40
Heating	20	-	7	87

* REFRIGERANT PIPE LENGTH 5m

[3] TEMPERATURE AT EACH PART AND PRESSURE IN 3-WAY VALVE

Model	12LR-N		9LR-N	
	Cooling	Heating	Cooling	Heating
Temp. on ① (°C)	66	63	66	65
Temp. on ② (°C)	40	2	40	2
Temp. on ③ (°C)	14	22	14	23
Temp. on ④ (°C)	17	6	16	6
3-way valve pressure (MPaG)	1.05	2.14	1.04	2.23

* On test run mode

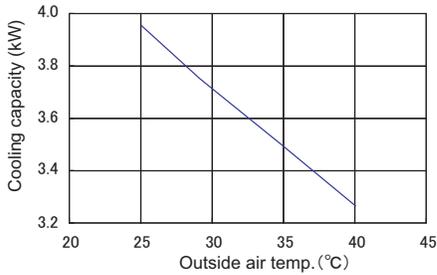

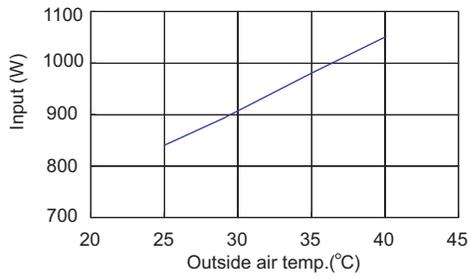

[4] PERFORMANCE CURVES

NOTE

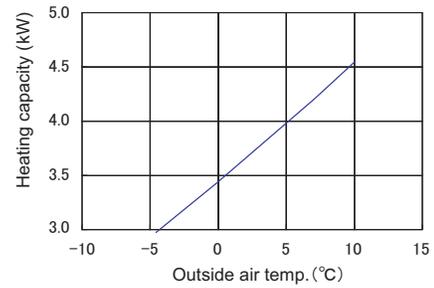

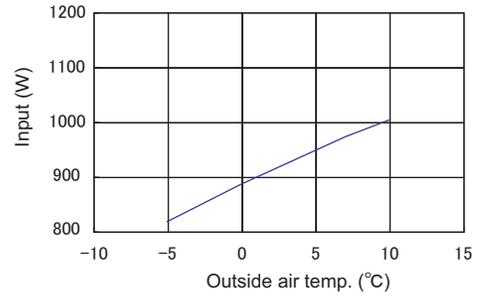

- 1) Indoor fan speed: Hi
- 2) Vertical adjustment louver "45°", Horizontal adjustment louver "front"
- 3) Indoor air temp.: Cooling 27°C, Heating 20°C
- 4) Power source: 230V, 50Hz
- 5) Performance corresponding to change in outside temperature when compressor is fixed to rated operation.

1. 12LR-N

1.1. At Cooling

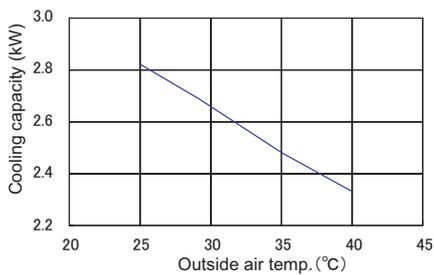

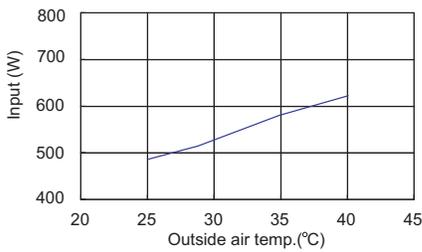

1.2. At Heating

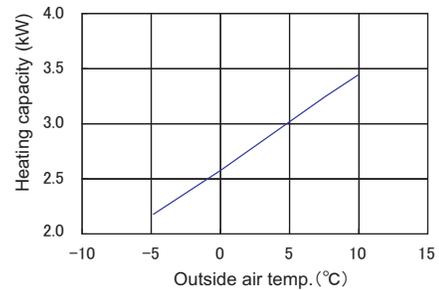

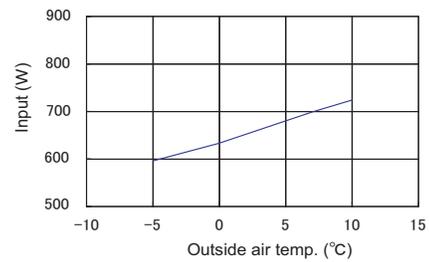

2. 9LR-N

2.1. At Cooling

2.2. At Heating

CHAPTER 5. DISASSEMBLY PROCEDURE

Be sure to disconnect the power cord from the AC power outlet before starting the disassembly procedure.

Be sure to install screws to their original positions after repairing

After the air conditioner is repaired or parts are replaced, measure insulation resistance of the equipment using an insulation resistance meter. If the measured resistance is lower than 1 MΩ, inspect parts and repair or replace defective parts.

[1] INDOOR UNIT

1) Open the open panel.

2) Remove a screw fixing the cord holder.

3) Remove the cord holder.

4) Loosen the screws on the terminal board remove the Unit-to Unit wiring connected with board.

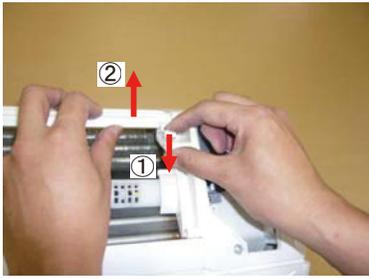

5) Slide out the 2 air filter.

6) Pull out two hooks and remove the panel.

7) Remove the grill (Unhook the 3 hooks shown in the picture.)

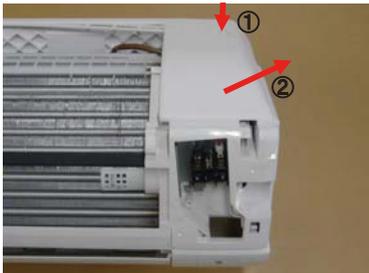

8) Remove the 2 screws fixing the front panel R and front panel L.

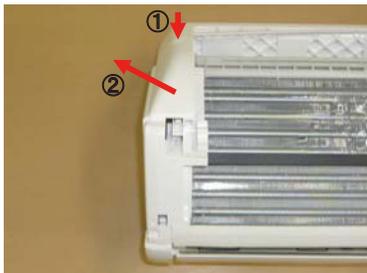

9) Remove the front panel R.

Push the upper hook and pull the front panel R out.

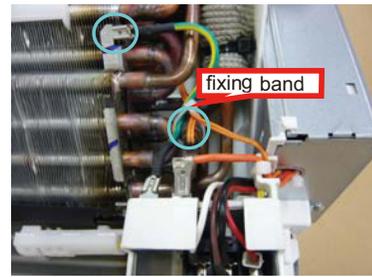

10) Remove the front panel L.

Push the upper hook and pull the front panel L out.

11) Cut the fixing band and remove the thermistor and earth wire.

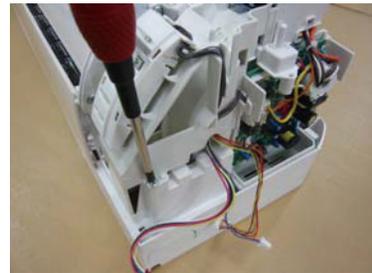

12) Remove the screw fixing the control box cover.

13) Remove the 3 connectors. (FAN MOTOR, LOUVER MOTOR and PLASMCLUSTER)

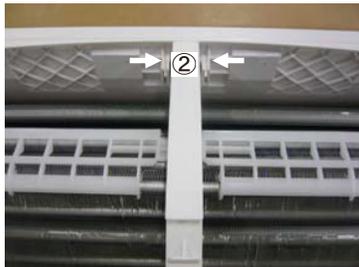

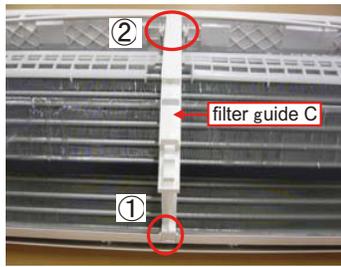

14) Unscrew the screw and remove the control box.

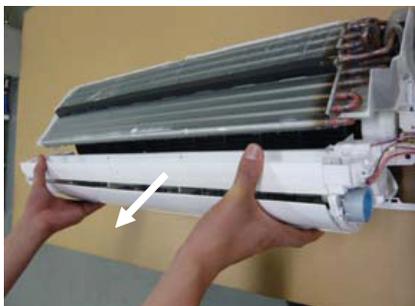

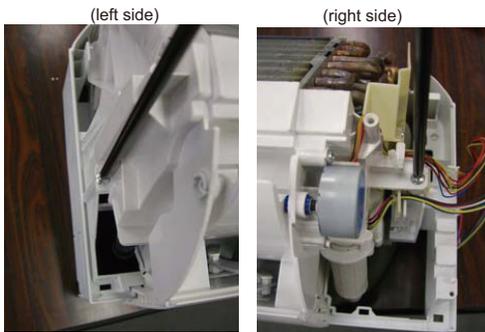

12LRN

15) Unhook the 2 hooks and remove the filter guide C.

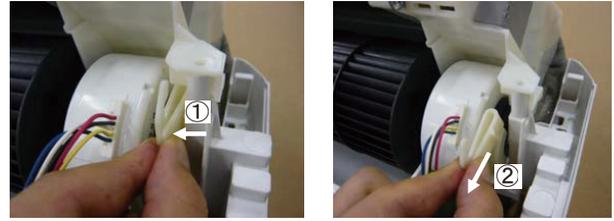

16) Unscrew the 2 screws and remove the drain pan assembly.

17) Unhook of the motor cover.

Support the motor with your hand when unhooking the motor cover.

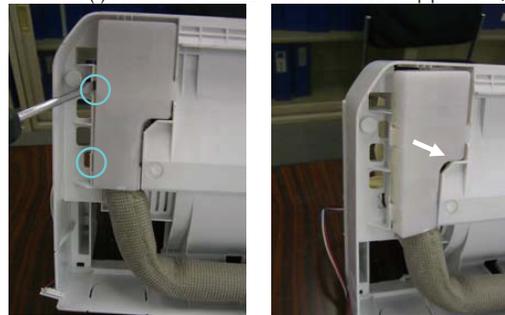

18) Slide the Cross-flow fan motor to the right and remove it.

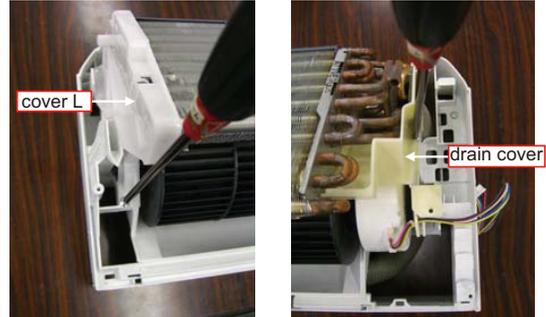

19) Remove the pipe holder.

• Insert the (-) screwdriver in the 2 holes to unhook the pipe holder.

20) Remove the cycle assembly

a) Remove the 2 screws fixing the cover L and drain cover.

b) Lift the left side of the evaporator and pull out the pipe from the cabinet.

[2] THE WIRE GUARD AND THE PLASM-CLUSTER UNIT

1) Remove the 2 screws fixing the guard holder L and guard holder R.

(left side)

(right side)

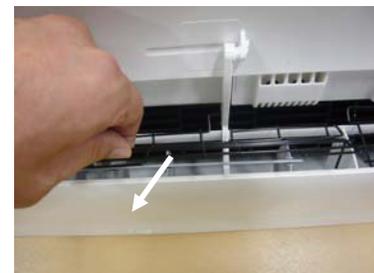

2) Pull the left side of wire guard forward, and the hook of the guard holder L will be unhooked.

3) Rotate the guard holder L in clockwise and remove.

4) Slide the wire guard L to the left and remove.

12LRN

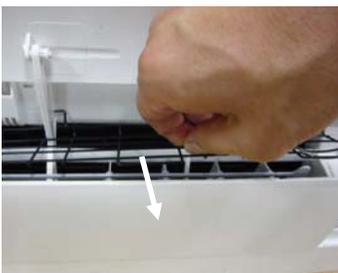

5) Pull the right side of the wire guard R, and unhook the guard holder R.

6) Rotate the guard holder R in anticlockwise and remove.

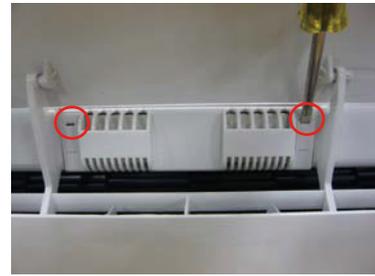

7) Slide the wire guard R to the right and remove.

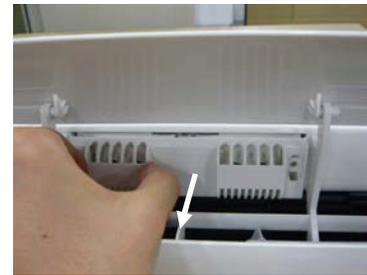

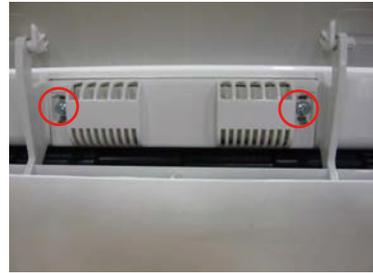

8) Remove the 2 screw covers.

• Insert the (-) screwdriver in the 2 holes.

9) Unscrew the 2 screws.

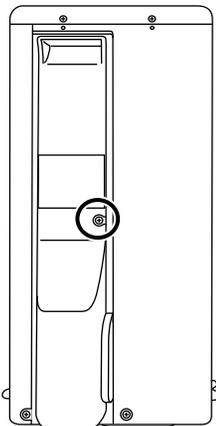

10) Disconnect the connector, and remove the plasmacluster unit.

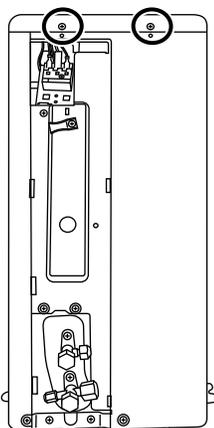

[3] OUTDOOR UNIT

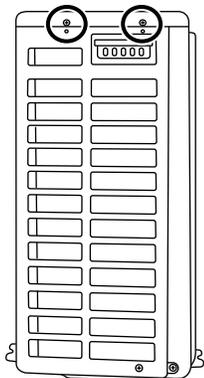

1) Unscrew the screw and remove the control box cover.

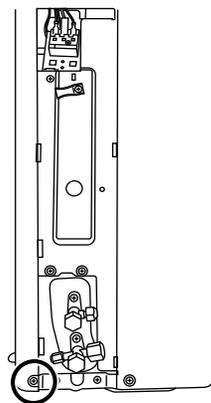

2) Unscrew the 2 screws on the right side of the top plate.

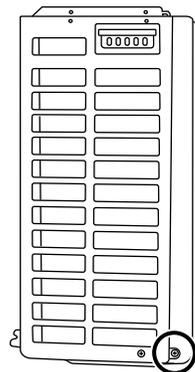

3) Unscrew the 2 screws on the left side of the top plate, and remove the top plate.

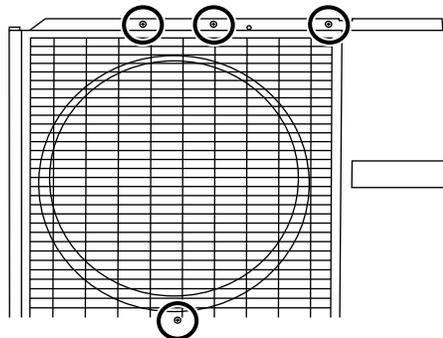

4) Unscrew the screw on the right side of the front panel.

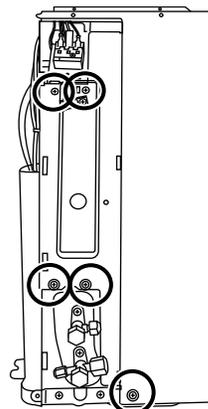

5) Unscrew the screw on the left side of the front panel.

6) Unscrew the 4 screws on the front panel, and remove front panel.

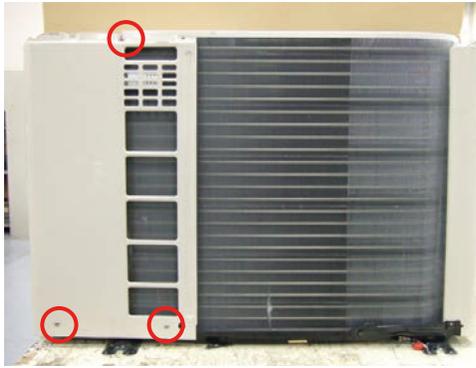

7) Unscrew the 5 screws on the side cover R.

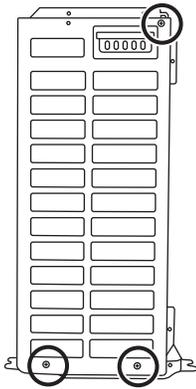

12LRN

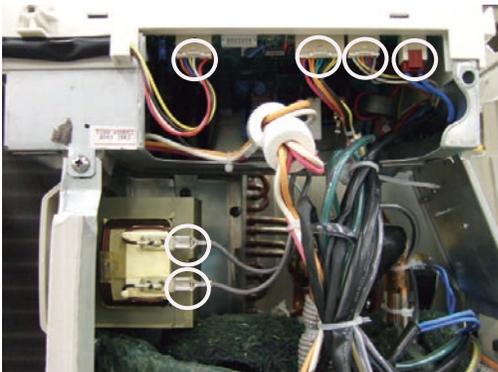

8) Unscrew the 3 screws on the back side of the side cover R, and remove the side cover R.

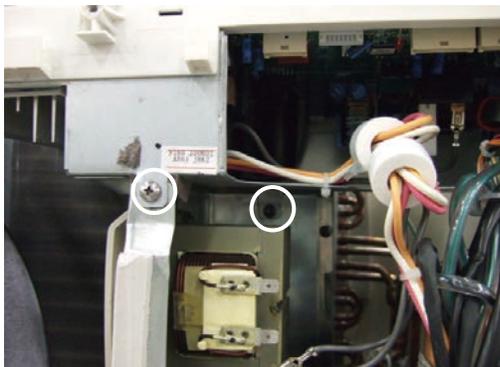

9) Unscrew the 3 screws on the side cover L, and remove the side cover L.

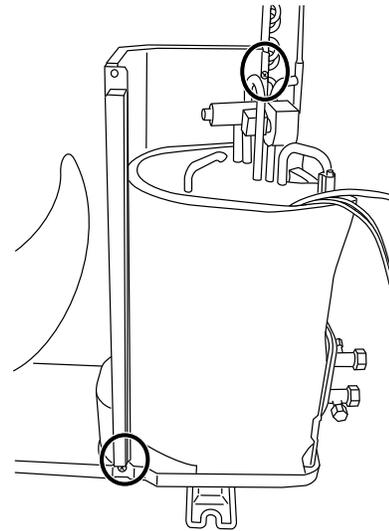

10) Remove the connectors and reactor in the control box.

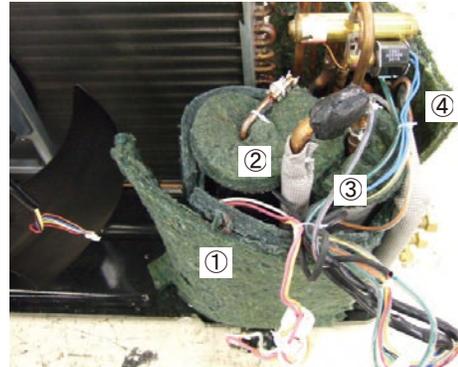

11) Remove the 2 screws fixed the control box.

12) Remove the 2 screws fixed the bulkhead plate.

13) Remove the compressor covers 1, 2, 3 and 4.

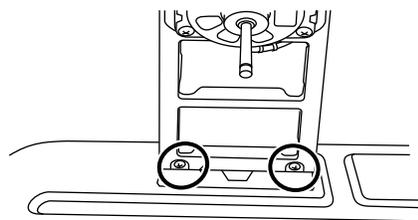

14) Remove the nut, and remove the terminal cover.

15) Remove the lead wire, the thermistor, and the cover gasket.

19) Unscrew the 2 screws and remove the motor angle.

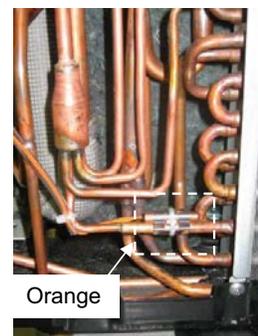

16) Remove the compressor cover.

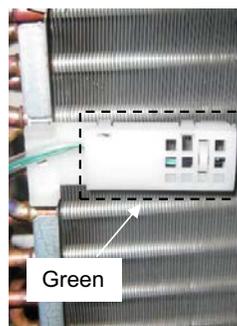

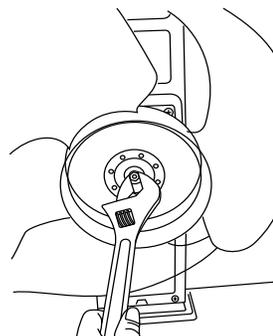

20) *Thermistor position.

17) Remove the 5 thermistors. *

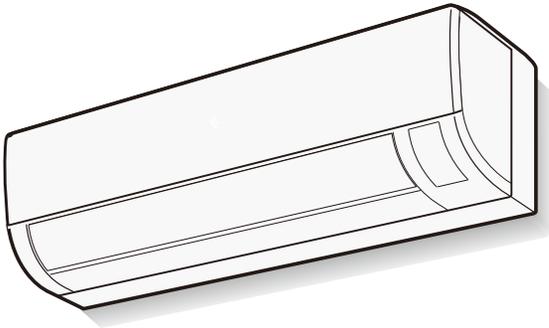

18) Remove the outdoor fan.

PARTS GUIDE

SPLIT TYPE AIR TO AIR HEAT PUMP

MODEL **12LR-N**
09LR-N

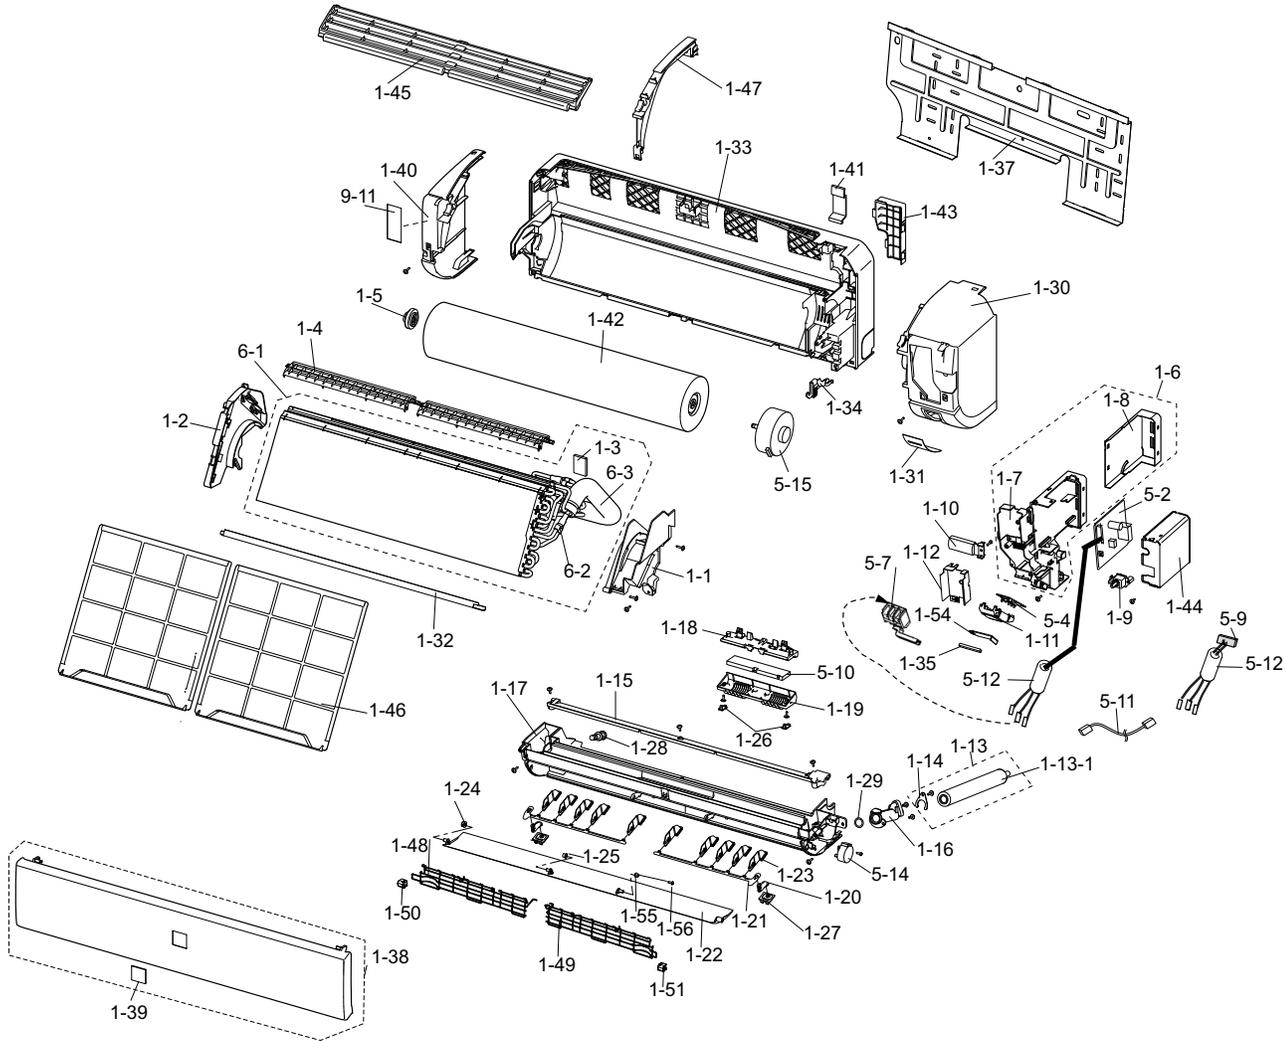

In the interests of user-safety (Required by safety regulations in some countries) the set should be restored to its original condition and only parts identical to those specified should be used.
